## FORWARD

The General Population Census of Cambodia of 2019 provides a crucial opportunity to examine past achievements and to guide future development plans and strategies. Aware of the vital importance of the project, the Royal Government of Cambodia allocated major national resources towards the implementation of the Census.

I am gratified that the Census has been a success and that reliable and timely data will be made available to specialized users and the general public. In addition to the present document, a range of thematic reports will be generated by the National Institute of Statistics, with the assistance of specialists from various sectors, including academia.

On behalf of the Ministry of Planning, I would like to express our deep gratitude to Samdech Akka Moha Sena Padei Techo HUN SEN, Prime Minister of the Kingdom of Cambodia. His unwavering support has been integral to the successful completion of the Census. I would also like to extend our sincerest thanks to Samdech Kralahorm Sar Kheng, Deputy Prime Minister, Minister of the Interior and Chairman of the National Census Committee (NCC) and the other members of the Committee, for their guidance.

As Chair of the Technical Committee and the Publicity Committee for the General Population Census of Cambodia of 2019 and on behalf of the Ministry of Planning - I would like to thank all members of the census committee working in the capital, provinces, municipalities, districts, khans and communes/sangkats. They did an excellent job and, by working together, we have been able to successfully implement our planned activities and obtain valuable results.

I would also like to thank the United Nations Population Program (UNFPA), the Swedish International Development Cooperation Agency (SIDA) and the Federal Republic of Germany and their implementer, the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ). Their financial and technical assistance supported the census planning and also the data entry, cleaning and analysis phases. They also provided training in report writing and helped draft the final census report.

I would like to thank Dr Nott Rama Rao for providing technical assistance in the census planning process and for reviewing all technical aspects of the census. And Dr Ricardo Neupert, Census Chief Technical Advisor, for providing overall technical assistance, particularly in writing the final census report. Dr Arij Dekker also provided much-appreciated help with the data cleaning and the preparation of the census priority tables. And Kjell Tambour, Senior Advisor with Statistics Sweden/SIDA, provided welcomed assistance with the data processing.

I would like to express my special thanks to the Government of the People's Republic of China for providing material assistance worth a total of $\$ 2.5$ million to support the census. This valuable contribution included automobiles, motorcycles, desktops, laptops, printers, photocopiers, tablets, servers and other electronic devices.

Last but not least, I would like to express my gratitude and appreciation to all staff of the National Institute of Statistics. H.E. Ms. Hang Lina, Delegate of the Royal Government of Cambodia in-charge of Director-General of the National Institute of

Statistics, who carefully coordinated all census operations, with the assistance of Deputy Directors-General H.E. Sok Kosal, H.E. Saint Lundy and H.E. They Kheam. I would like to express particular thanks to all compatriots who supported and participated in the successful completion of census operations in the Kingdom of Cambodia in 2019.

We are pleased to present to line-ministries, international agencies, nongovernment organization, policy makers, programme implementers, development planners, and researchers a publication with a plethora of useful information of a series of thematic reports. We hope to receive feedback and contributions from our readers to learn from mistakes and improve subsequent Series Census publications.

## Senior Minister Minister of Planning

Kitti Settha Pandita Chhay Than

## PREFACE

The General Population Census of Cambodia (GPCC) 2019 was conducted not only to obtain the much needed demographic data following the census, but also to serve as a means to train the staff of the NIS and Provincial Planning Offices in demographic data collection. In particular, the level emphasized for clarity that the analyses of sociodemographic profile of old people and ageing situations of the Cambodian population are discussed. This report contains an in-depth analysis on population ageing and their living conditions in Cambodia based on the results of GPCC, 2019. There were plans to produce many series of thematic reports based on the results of the census, on other topics of interest furthermore, some 18 thematic reports are expected to be issued in 2020 and 2021.

I would like to extend special thanks are due to Kitti Settha Pandita Chhay Than, Honorable Senior Minister, Minister of Planning whose keen interest in the census and in the survey was always a source of inspiration and encouragement both to the national and international staff of the project.

Our special thanks to UNFPA, GIZ, UNICEF, WHO, and other DPs for undertaking the coordinating role for the census and for their technical support. The Royal Government of Cambodia through the Ministry of Economy and Finance has provided full financial support. I am also grateful to the People's Republic of China for supplying equipment such as vehicles, motorbikes, computers, printers and photocopiers, which were and still are essential for census operations.

Finally, I wish to thank all the staff of the National Institute of Statistics, the Provincial Census Officers, the District Census Officers, the Commune Census Officers, village chiefs, field supervisors and enumerators for their dedication and hard work. This has enabled us to produce timely data of good quality. My acknowledgements would be incomplete if I did not mention the general public who provided the much-needed information without hesitation

## Executive Summary

Population ageing has been a trend in the developed world, but it is also a rapidly expanding shift in many of the developing countries. Cambodia, with its vision to become a highincome country by 2050, is also facing a transition in an ageing population. The current report is an analysis of the 2019 Census data in Cambodia, focusing on the demographic shifts in the population aged 60 years and above, and projected data for up to 2050 (up to 2030 in natural regions and provinces), to allow the Cambodian government to consider proactively how this shift in demography of the population will be addressed.

In 2019, the older population was $1,378,688$ people out of a total population of 15,552,211 people living in Cambodia. Hence, the older population represents $8.86 \%$ of the total population, about $60 \%$ more than the older population recorded in the 2008 Census. This number is projected to reach $23.17 \%$ of the total population by 2050 . Among the older population, 6 out of 10 are in the age group of $60-69$ years old, 3 out of 10 in the age group of 70-79 years old, and 1 in 10 is older than 80 years old. The number of old women was much larger than old men. There are only 66.3 men for every 100 older women, suggesting a feminization of older population. However, gender will be more balanced by 2050, with 87.66 old men for every 100 old women.

Various demographic ratios also clearly show the significant and rapid shift in population ageing. For instance, the old age dependency ratio is currently 14.36 , but will reach 37.76 by 2050 . The index of ageing is currently 30.16 , but by 2050 will reach a high of 149.72. The Parent Support ratio is currently 11.59, larger than 2008 ( 9.9 ), and will reach 31.98 by 2050. Disabilities in relation to activities of daily living are also common in this population. Besides, there are regional variations in the population ageing. Additionally, the most common causes for death in this population are both infectious (e.g., diarrhea disease) and non-communicable diseases (i.e. heart conditions).

The detailed analysis of Census data provide strong evidence of population ageing in Cambodia and the specific aspects that affect this vulnerable population. Cambodia has taken a very proactive approach in addressing key issues in this population, and the implementation of these policies needs to be reviewed regularly. Other areas to consider in future planning include addressing functional disabilities, providing more specialized training in health and social care professionals, enhancement of community health centres to focus more concretely on the needs of the older population, focus on creating an environment supporting healthy ageing, consider older people as an investment in human capital, consider more gender-specific support mechanisms, and address poverty issues in this population, particularly in the rural areas. The continuation of the life course approach that Cambodian planning has taken is also crucial for the long-term.

## Chapter 1

## Introduction

Since the 19th century, life expectancy has increased substantially across the world [1]. Rising life expectancy and declining fertility rates caused the ageing of populations worldwide [2]. Population ageing is a human success story [3], but it also holds substantial implications for economic and social development and for environmental sustainability [4]. Population ageing is a worldwide phenomenon [3]. According to United Nations report on world population ageing, the number of global population aged 65 years or over was 703 million in 2019. This number is expected to double to 1.5 billion in 2050, and the share of the population aged 65 years or over is also projected to increase from 9 percent in 2019 to 16 percent in 2050 when it is expected that one in six people around the world will be aged 65 years or over [3]. Compared with developed countries, the ageing of population should be highly recognized and addressed particularly for the developing world, where the pace at which this phenomenon unfolds is striking [2].

In Cambodia, the older population (aged 60 years and above) also increased at a higher rate than the total population [5]. In 1998, the percentage of the population aged 60 years and above in Cambodia was 5.25, and it increased to 6.34 in 2008 [6] and 8.86 in 2019. In 2050, the percentage is projected to reach 23.17 . This is related to the decline in fertility rates and the increase in life expectancy in Cambodia. From 2008 to 2019, the total fertility rate in Cambodia declined from 2.7 children per woman to 2.5 [7]. Meanwhile, male and female life expectancy increased by 13.49 years (from 60.81 years to 74.3 years) and 13.14 years (from 63.66 years to 76.8 years), respectively [6, 7]. Rapid population ageing will present substantial challenges to the country. Therefore, it is more important than ever that the Royal Government of Cambodia designs innovative measures and public health polices specifically targeted to older persons.

Cambodia has been a signatory to the Madrid International Plan of Action on Ageing (MIPAA) adopted at the Second World Assembly on Ageing since 2002 and has paid special attention on the needs of the older population over the past several years. The current thematic report aims to present a comprehensive description and understanding of the older population demography in Cambodia in 2019, providing practical implications for the development of population-related policies.

### 1.1. Background

The General Population Census of Cambodia 2019 (GPCC 2019) is the fourth census in a series of census-taking in the Kingdom of Cambodia. It is part of the 2020 Round of Population and Housing Censuses, as recommended by the United Nations. The first census in Cambodia was conducted in 1962, with follow-up exercises undertaken in 1998 and 2008. Cambodia continues to use paper-based questionnaires and pencil recording to collect data. This required a thorough preparation of questionnaires, manuals, training guides, pre-test and pilot census, and so forth.

Census preparations started in early 2016 by developing an initial census plan, which was approved by the Royal Government of Cambodia. A National Census Committee was formed in 2017. A census strategy was formulated also in 2017, which allowed the enumeration to commence on March 3, 2019. The National Institute of Statistics (NIS) produced the enumeration maps using hand-sketched area plans across the country. Every Enumeration Area (EA) is separately delineated.

The previous three censuses enabled the Royal Government of Cambodia to build up its capacity for conducting the Census of 2019. The inquiry covers population data as well as certain household characteristics. Results from the census will provide essential demographic and household data for all forms of evaluation and planning.

### 1.2. Organization Structure

As in the past, the National Committee for the Census, headed by H.E. Samdech Kralahorm Sar Keng, Deputy Prime Minister and Minister of the Interior, is the apex body. It includes members from all line ministries responsible for policy matters concerning the census. The Census Technical Committee, headed by H.E. Kitti Settha Pandita Chhay Than, Senior Minister, Minister of Planning, is in charge of technical issues relating to the census such as the design of the questionnaires, training guides, and the supervisor and enumeration manuals. It is also in the lead for the pilot census, training events, the field enumeration, editing and coding, data entry and the preparation of analytical reports. The Committee of Census Publicity and Advocacy, also led by H.E. Kitti Settha Pandita Chhay Than, Senior Minister, Minister of Planning, is in charge of oversight and advice on informing the population through printed publications, television spots, banners, flyers, t-shirts, labelled bags, and more.

The Ministry of Planning is in day-to-day charge of the census operations, with the NIS serving as the implementing agency.

Provincial Planning Departments acted as Provincial Census Offices during the census operation, with the Director of the Provincial Planning Department taking the role of Provincial Census Officer, the senior officer in the province responsible for census operations. Provincial Census Officers were each supported by a specialized assistant. Census Officers at the district/commune level and village chiefs were under the supervision of the Provincial Census Officer. The Municipal/Provincial Governors acted as Chair of the Municipal/Provincial Census Committees responsible for oversight of the census operations in their municipality or province. Regional Officers from the National Institute of Statistics were assigned to provide technical assistance to the Provincial Census Officers.

### 1.3. Field Operation

The Census enumerated some 3.5 million regular households present in the widely differing lands of the 25 municipalities and provinces of the country. The preparatory household listing operation took from 28 February to 2 of March 2019. Enumeration proper, through Form B, the actual questionnaire, started on midnight March 3 and lasted until March 13. As mentioned before, the census deployed some 38,447 enumerators and about 9,200 supervisors to collect the data in a total of 14,545 villages. There were a little more than 37,000 regular EAs, with the remainder of the staff assigned to special settlements such as camps, prisons, hospitals and so forth. Homeless persons, including those staying in boats, were enumerated during census night.

Most households nation-wide were covered during the period of 11 days, respecting the deadline of 13 of March 2019. But in Preah Sihanouk province the work had to be extended for 3 days and a special team from the NIS was deployed to support the provincial team. This was because of an unexpected increase of households following a recent influx of Chinese population. Furthermore, the enumeration in Phnom Penh had to be extended until 20 of March 2019. Again this was caused by the existence of many new households in the city.

Enumerators and other census officers traveled long distances to reach remote and forested areas. The field staff used vehicles, motorcycles, bicycles and boats. Mobile phone communication was highly useful during census work. It provided supervisors and enumerators with the opportunity to contact core staff when assistance was needed.

Time Table of Major Census Field Work

| Date | Activities |
| :--- | :--- |
| February 28 to March 2, 2019 <br> 3 days) | Household listing in EAs and updating the EA maps |
| March 3, 2019 nighttime | Enumeration of the homeless and transient population |
| March 3 to 13, 2019 (11 days) | 2019 Enumeration with midnight of March 3 <br> $(00: 00 \mathrm{AM})$ as the reference moment |
| March 13 to 14, 2019 | Collection of completed census documents at field offices |
| March 15 to 22, 2019 | Receipt of completed census records at the NIS in Phnom Penh |

### 1.4. Objective of the report

This thematic report seeks to present the demographic data of people aged 60 years and older in Cambodia in 2019 and also project the demographic trends up to 2050. This report also makes comparison with the reports based on previous census data. Additionally, differences in the ageing process by natural region, province, and place of residence are discussed. This report aims to present a comprehensive description and understanding of the older population demography in Cambodia, and hence provide practical implications for the development of population-related policies.

### 1.5. Data Sources

Data used in this report were mainly drawn from the General Population Census of Cambodia 2019. Some data were obtained from published Cambodia government reports such as National Report on Final Census Results based on the General Population Census of the Kingdom of Cambodia 2019, Demographics of Population Ageing in Cambodia 2012, and National ageing policy 2017-2030.

### 1.6. Methodology

## Concepts and Definitions

The term 'older persons' in this report refers to population those aged 60 years and above, as the retirement age in Cambodia is 60 years. This is also congruent with the WHO definition of old people.

The old age dependency ratio is the ratio of persons aged 60 years and above to the working age population (15-59 years), while the young age dependency ratio is the ratio of persons aged 14 years and younger to the working age population (15-59 years).

The potential support ratio is a measure of the available support base for the older people and is the inverse of the old age dependency ratio.

The Parent Support Ratio is the ratio of the number of persons aged 80 years and above per 100 persons aged 50 to 59 years and is an approximate measure of the available support for older parents from their families.

The sex ratio represents the number of males for every 100 females.
People who are literate are defined as people who can read and write with understanding in Khmer and other languages such as Vietnamese, Chinese, Lao, Thai, French, English, Chaam, etc.

The index of ageing is the percentage of number of population aged $60+$ to the number of the population aged 0-14.

Six types of disabilities were reported in the 2019 Cambodia census, including (1) in seeing, (2) in hearing, (3) in walking, (4) in remembering/concentrating, (5) in self-care, and (6) in using usual language. Disabilities are defined as those areas of life having some/major/full difficulties in seeing, hearing, walking, remembering/concentrating, self-care or using usual language.

Economically active older population include those who were employed and unemployed. Not economically active people include homemakers, students, dependent rent receivers, retired or other income recipients, and others who are not economically active for most of the time and who do not come under any of the above categories.

## Statistical Tool

Descriptive statistics data analyses in this report were conducted using Stata and Microsoft Office.

## Data Aggregation

Data in this report were aggregated by age group, sex, natural region, province, and place of residence.

### 1.7. Report Structure

This report covers some broad areas by including the age structure and mortality information of the total Cambodia population. The report also provides some key statistics, namely, socio-demographic profile of older persons, areas of vulnerability for older people, regional variations in the population ageing, disabilities in older population, economic characteristics of older people, and causes of death among older population. This report also makes comparison with the reports based on previous census data and projects the demographic trends up to 2050. Therefore, the report presents a comprehensive description and understanding of the older population demography in Cambodia, and hence provide practical implications for the development of population-related policies.

## Chapter 2

## Socio-Demographic Profile of Older Persons

The term 'older persons' in this report refers to population those aged 60 years and above, as the retirement age in Cambodia is 60 years. This is also congruent with the WHO definition of old people.

According to the 2019 census, the total number of population in Cambodia is $15,552,211$. The numbers of men and women were $7,571,837$ and $7,980,374$, accounting for $48.69 \%$ and $51.31 \%$ of the total population, respectively (Table 1 ). In the next few decades, the number of population in Cambodia is expected to further increase. In 2050, the number will reach $21,728,446$, with men and women increasing to $10,806,195$ and $10,922,251$, respectively (Table $2)$.

Table 1. Population by sex and age group in Cambodia, 2019

| Age Group |  | Males | Females | Total |
| :---: | :--- | :---: | :---: | :---: |
| $0-14$ | Number | $2,342,395$ | $2,228,745$ | $4,571,140$ |
|  | Percentage | 15.06 | 14.33 | 29.39 |
|  | Number | $4,679,961$ | $4,922,422$ | $9,602,383$ |
|  | Percentage | 30.09 | 31.65 | 61.74 |
|  | Number | 549,481 | 829,207 | $1,378,688$ |
|  | Percentage | 3.53 | 5.33 | 8.86 |
|  | Number | $7,571,837$ | $7,980,374$ | $15,552,211$ |
|  | Percentage | 48.69 | 51.31 | 100.00 |

In 2019, the total number of the population aged 60 years and older in Cambodia was $1,378,688$, much larger than that in $2008(848,911)$. The proportion of the older population increased from $6.34 \%$ in 2008 to $8.86 \%$ in 2019. The numbers of old men and women were 549,481 and 829,207 , accounting for $3.53 \%$ and $5.33 \%$ of the total people in Cambodia (Table 1). In 2050 , the total number of the older population is projected to be $5,033,966$, accounting for $23.17 \%$ of the total population (Table 2), almost tripling in the following three decades in comparison with the current level. The numbers of old men and women will be 2,351,430 and $2,682,536$, representing $21.76 \%$ and $24.56 \%$ of the total number of men and women in Cambodia. Meanwhile, the number of people aged 14 years and younger will decrease continuously, from $29.39 \%$ in 2019 to $15.47 \%$ in 2050 . People aged $15-59$ years, however, will not change too much over the next decades (Figure 1).

Table 2. Population by broad age group in Cambodia, 2019-2050

| Year | Gender | 0-14 |  | 15-59 |  | 60+ |  | Total |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Number | Percentage | Number | Percentage | Number | Percentage | Number | Percentage |
| 2019 | Males | 2,342,395 | 30.94 | 4,679,961 | 61.81 | 549,481 | 7.26 | 7,571,837 | 100.00 |
|  | Females | 2,228,745 | 27.93 | 4,922,422 | 61.68 | 829,207 | 10.39 | 7,980,374 | 100.00 |
|  | Total | 4,571,140 | 29.39 | 9,602,383 | 61.74 | 1,378,688 | 8.86 | 15,552,211 | 100.00 |
| $2030$ | Males | 2,351,993 | 25.52 | 5,844,905 | 63.41 | 1,020,044 | 11.07 | 9,216,942 | 100.00 |
|  | Females | 2,245,647 | 23.59 | 5,922,881 | 62.22 | 1,350,507 | 14.19 | 9,519,035 | 100.00 |
|  | Total | 4,597,640 | 24.54 | 11,767,786 | 62.81 | 2,370,551 | 12.65 | 18,735,977 | 100.00 |

| $85-89$ | 17,004 | 3.09 | 29,832 | 3.60 | 46,836 | 3.40 |
| $90+$ | 7,383 | 1.34 | 12,682 | 1.53 | 20,065 | 1.46 |
| Total | 549,481 | 100.00 | 829,207 | 100.00 | $1,378,688$ | 100.00 |

Table 3 presents a more detailed distribution of the older population across different age groups. In 2019, the young old age groups (60-64 and 65-69 years) accounted for a major proportion of older people in Cambodia ( $33.82 \%$ and $26.08 \%$, respectively), followed by the middle old age groups (70-74 and 75-79 years), which composed $17.51 \%$ and $11.21 \%$ of the total old Cambodian population. The proportion of the very old population aged 80 years and above, however, was much lower in comparison with other old age groups $(11.4 \%$ of the total old population).

In 2019, the total number of old women in Cambodia was 829,207 , much larger than their male counterparts $(549,481)$. For both sexes, the proportions of the young old age group (60-69 years) were the largest ( $60.65 \%$ for men and $59.39 \%$ for women, respectively), followed by middle old people aged $70-79$ years ( $28.71 \%$ for men and $28.72 \%$ for women, respectively) and the very old people aged $80+$ years $(10.63 \%$ for men and $11.89 \%$ for women, respectively). Compared to old men, old women accounted for a smaller portion at young old age groups yet a larger portion at the very old age groups. However, the gap was not significant across sexes.

Figure 2. Percentages of older age groups to the total population in Cambodia, 2019-2050

Over the next three decades of 2019-2050, the proportions of the old population to the total population at different age groups are generally expected to further increase (Figure 2). In 2019, population aged $60-64$ and $65-69$ years had relatively greater proportions $(3.0 \%$ and $2.31 \%$, respectively), followed by 70-74 year age group which represented $1.55 \%$ of the total population. The percentage of $80+$ years was $1.01 \%$, a little bit larger than that of 75-79 year age group ( $0.99 \%$ ). In 2050, the old population aged $60-64$ and $65-69$ years will account for more than 6 percent of the total population in Cambodia ( $6.12 \%$ for the group of $60-64$ years and $6.13 \%$ for the group of 65-69 years). Besides, the proportion of the oldest-old age group ( 80 years and above) will be $3.97 \%$, exceeding the 70-74 and 75-79 age groups ( $3.71 \%$ and $3.24 \%$, respectively).

Figure 3 shows the proportion of population in Cambodia across natural regions and broad age groups. In 2019, the percentage of older population was $8.86 \%$ in Cambodia. More specifically, the largest percentage of older population was found in the Plain Region, accounting for approximately $9.77 \%$ of its total population, followed by the Tonle Sap Region and the Coastal Region ( $8.42 \%$ and $8.01 \%$, respectively). The proportion of older population in the Plateau and Mountain Region was $6.95 \%$, lower than the other three natural regions.

Figure 3. Percentages of Population by broad age group in Cambodia, 2019

According to the 2019 Census, the vast majority of the old population (96.5\%) in Cambodia had Khmer as their mother language (Table A3). For the Cambodian old people, Buddhism was the main religion, accounting for $97.2 \%$ of the total older people (Table A4). Besides, most of them lived in normal or regular households (98.93\%), and this was also the case across all natural regions and provinces in Cambodia (Table A5). The position of the old population in the household varied greatly across sexes, as shown in Table A6. Over $80 \%$ of the old men were head in their households, but for old women, the percentage was only around $34 \%$. However, the proportion of roles as spouse and parent were much higher among old women.

The changing population dynamics in Cambodia is the joint impact of the declining fertility and increasing longevity. The total fertility rate (TFR) in Cambodia declined from 2.7 children per woman in 2008 to 2.5 in 2019 [7]. Besides, Cambodia has made substantial increases in life expectancy for both sexes. Between 2008 and 2019, male and female life expectancy increased by 13.49 years (from 60.81 years to 74.3 years) and 13.14 years (from 63.66 years to 76.8 years) [6, 7]. Changes in population age structures can be reflected by the population pyramids in Cambodia in different years shown in Figure 4.

Figure 4a. Age, sex population pyramid, Cambodia, 2019 Figure 4b. Age, sex population pyramid, Cambodia, 2030

Figure 4c. Age, sex population pyramid, Cambodia, 2040
Figure 4d. Age, sex population pyramid, Cambodia, 2050

## Chapter 3

## Areas of Vulnerability for Older People

### 3.1 Increasing Old Age Dependency

The old age dependency ratio is the ratio of persons aged 60 years and above to the working age population (15-59 years), while the young age dependency ratio is the ratio of persons aged 14 years and younger to the working age population (15-59 years).

Figure 5. The Trend in Dependency Ratios, Cambodia, 2019-2050

In 2019, the total dependency ratio (the ratio of persons aged $60+$ and $0-14$ years to the working population aged $15-59$ years) was 61.96 but it is expected to decline to 56.04 by 2040, followed by a rise to 62.98 in 2050. The young age dependency ratio will decline constantly between 2019 and 2050 (from 47.60 in 2019 to 25.22 in 2050). On the contrary, the old age dependency ratio will continue increasing, particularly after 2040 (from 14.36 in 2019 to 37.76 in 2050), as shown in Figure 5. In 2019, the Tonle Sap Region had the largest total dependency ratio (67.06), followed by the Plateau and Mountain Region (63.01) and Plain Region (59.70). The total dependency ratio was lowest in Coastal Region (54.35). In terms of old age dependency ratio, the Plain Region had the highest level than the other three natural regions. Projected dependency ratios across Natural Regions and Provinces in the following years were listed in Table A7.

### 3.2 Levels of Potential Support

The potential support ratio is a measure of the available support base for the older people and is the inverse of the old age dependency ratio.

Figure 6. Potential support ratio, Cambodia, 2019-2050

As shown in Figure 6, in 2019, the potential support ratio in Cambodia was 6.96, much lower than that in 2008 (14.5). In the next few decades, the number is expected to decline further. Between 2019 and 2050, the expected potential support ratio will decrease from 6.96 to 2.65 in 2050. This suggests that with the increasing proportion of the older people, there will be fewer working age persons to support them economically during old age. It may be closely related to the declining fertility rate in Cambodia.

Current and future levels of potential support ratio vary across different Natural Regions and Provinces in Cambodia. Generally, potential support ratios for all natural regions and provinces will present a declining trend. In 2019, the lowest level of potential support ratio was seen in the Plain Region (6.41), and in 2030, it will further decrease to 4.57. Compared with other provinces, potential support ratios in Phnom Penh were relatively higher in both 2019 (8.77) and 2030 (6.18), despite a 2.59 -decline was found. This was contributed by its younger population age structure. The Plateau and Mountain Region, however, had the largest potential support ratio in all observed years (Table A8).

### 3.3 Number of Old Parents to Support

The Parent Support Ratio is the ratio of the number of persons aged 80 years and above per 100 persons aged 50 to 59 years and is an approximate measure of the available support for older parents from their families.

Figure 7. The Parent Support Ratio, Cambodia, 2019-2050

Generally, the parent support ratio in Cambodia presents an increasing trend. In 2019, the parent support ratio for Cambodia was 11.59 (Figure 7), larger than that in 2008 (9.9). In 2035, it will further increase to 15.87 , implying that those who are reaching the later stages of their working lives will have more aged relatives/parents to support in the future. After 2035, the parent support ratio will increase at a much faster pace. In 2050, it is expected to be 31.98 , almost triple the value in 2019.

### 3.4 Sex Ratio of the Older People

The sex ratio represents the number of males for every 100 females.
In 2019, the sex ratio for the population aged 60 years and above in Cambodia was 66.3 males per 100 females. The number is expected to increase further in the next three decades between 2019 and 2050. In 2050, the sex ratio for the old population aged 60 years and above in Cambodia will be 87.66. The rising trend can also be observed across different old age groups. Sex ratios are the largest for 60-69 age group. For those aged 60-69, sex ratio was 67.67 in 2019,
and it will increase to 94.32 in 2050. For the oldest-old age group ( 80 years and over), the increase in the sex ratio was relatively smaller. In 2019, sex ratio was 59.34 , and in 2050, it will be 68.61 (Figure 8).

Figure 8. The Sex Ratio of Elderly by broad age group in Cambodia, 2019-2050

Regional variations in the sex ratio among the old population also exist in Cambodia (Table A9). In 2019, the sex ratio for people aged 60 years and over in the Plain Region was 64.74 , lower than the other regions, particularly the Plateau and Mountain region, which had a sex ratio of 70.22. For all the four regions, the sex ratios among the population aged 60 years and over show an increasing trend over the projected period 2019-2030 (Table A9).

### 3.5 Increased Likelihood of Losing One's Spouse

A major transition into old age occurs due to the loss of spouses that contributes to a feeling of increased insecurity among both old men and women. In 2019, the married older people accounted for $73.04 \%$ of the total older population ( $88.90 \%$ for old men and $62.52 \%$ for old women, respectively). About $27.84 \%$ of old women were widowed while only $7.56 \%$ of old men were widowers (Table 4). For the oldest-old age group ( 80 years and above), $48.65 \%$ of old women and $20.87 \%$ of old men lost their spouses (Table A10). The distribution of marital status was fairly similar across all regions. The issue of spousal loss and feeling insecurity is particularly common among the female older people in Cambodia, which deserves specific attention in any policy implementation.

Table 4. Distribution of the older population by sex and marital status, Cambodia, 2019

| Marital Status | Males |  | Females |  | Total |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number | Percent | Number | Percent | Number | Percent |
| Never Married | 9,207 | 1.68 | 37,937 | 4.58 | 47,144 | 3.42 |
| Married | 488,510 | 88.90 | 518,430 | 62.52 | 1,006,940 | 73.04 |
| Widowed | 41,525 | 7.56 | 230,873 | 27.84 | 272,398 | 19.76 |
| Divorced/Separated | 10,103 | 1.84 | 41,820 | 5.04 | 51,923 | 3.77 |
| Not Stated | 136 | 0.02 | 147 | 0.02 | 283 | 0.02 |
| Total | 549,481 | 100.00 | 829,207 | 100.00 | 1,378,688 | 100.00 |

### 3.6 Urban/Rural Areas

Population ageing varied by the place of residence. In 2019, about $9.28 \%$ of the older people lived in the rural area and $8.23 \%$ lived in the urban area (Table 5). In the following years, the proportions of the older people are expected to increase continuously. In 2030, $13.27 \%$ of the older population will live in the rural area, and the figure for their urban counterparts will be $11.70 \%$. The trend is similar for both male and female older people (Table A11). The proportion of the female rural population aged 60 years and above is expected to increase from $10.90 \%$ in 2019 to $14.94 \%$ in 2030 while the female urban older population is expected to rise from $9.61 \%$ in 2019 to $13.01 \%$ in 2030.

Table 5. Proportion of older population in Urban and Rural Areas in Cambodia, Natural Regions and Provinces, 2019-2030

| Cambodia/Natural Regions/Provinces | 2019 |  | 2025 |  | 2030 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Urban | Rural | Urban | Rural | Urban | Rural |
| Cambodia | 8.23 | 9.28 | 9.91 | 11.44 | 11.70 | 13.27 |

| Stung Treng | 6.37 | 5.59 | 7.70 | 6.96 | 9.30 | 8.05 |

### 3.7 Education Levels of the Older People

People who are literate are defined as people who can read and write with understanding in Khmer and other languages such as Vietnamese, Chinese, Lao, Thai, French, English, Chaam, etc.

Table 6. Attendance of School among old population by sex in Cambodia, 2019

| Attended School | Males |  | Females |  | Total |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number | Percentage | Number | Percentage | Number | Percentage |
| Never | 91,647 | 16.68 | 292,446 | 35.27 | 384,093 | 27.86 |
| Past | 456,507 | 83.08 | 534,278 | 64.43 | 990,785 | 71.86 |
| Not Stated | 1,327 | 0.24 | 2,483 | 0.30 | 3,810 | 0.28 |
| Total | 549,481 | 100.00 | 829,207 | 100.00 | 1,378,688 | 100.00 |

In 2019 , the majority of the older population ( $71.86 \%$ ) in Cambodia attended school in the past while $27.86 \%$ of them never attended school. For older females, $35.27 \%$ of the total female old people never attended school, much high than their male counterparts ( $16.68 \%$ ), suggesting the significant gap in receiving education between old men and old women in Cambodia (Table
6). With regard to education levels, for both sexes, most of the older population did not complete primary school, or finish primary and lower secondary school (Table A12). Therefore, improving the literacy level of the elderly in Cambodia is still necessary in the future.

For the older population in Cambodia, the level of literacy improved in urban as well as rural regions for both sexes between 1998 and 2019. In 2019, the percentages of literate people among the male population aged 60 years and over were $90.85 \%$ and $83.08 \%$ in urban and rural areas (Table A13), respectively, larger than the numbers in 1998 ( $73.23 \%$ in the urban area and $60.7 \%$ in the rural area) and $2008(88.2 \%$ in the urban area and $75.17 \%$ in the rural area). For old women, the percentage of literacy increased from $22.44 \%$ in 1998 to $56.87 \%$ in 2008 , and then $76.98 \%$ in 2019 in the urban area. In the rural area, the figure rose from $10.4 \%$ in 1998 to $32.58 \%$ in 2008 and further to $63.08 \%$ in 2019 . Over the past two decades, despite substantial achievements having been made in improving the level of literacy among the older people, there are noticeable gaps across sexes, with old women having lower levels of literacy than old men. The gender gaps can also been seen across natural regions and provinces (Table A13).

# Chapter 4 <br> Regional Variations in the Population Ageing 

### 4.1 Distribution of Older People

Significant regional differences in the number of older people in 2019 in Cambodia can be observed in Table 7. The Plain Region had the largest number of older people $(746,561)$, constituting more than a half of the total old population in Cambodia. In Phnom Penh, the number of the old population was 181,531 , representing $13.17 \%$ of the entire people aged 60 years and above in Cambodia, much larger than the other provinces. The number of old women $(106,820)$ was much greater than their male counterparts $(74,711)$. The Coastal Region had the smallest number of old population $(85,899)$, accounting for around $6.23 \%$ of the total old people in Cambodia. In Kep, there were merely 3,498 old people in 2019, and the share of the old people was only about $0.25 \%$.

With regard to the proportion of the elderly to the total population, in 2019, the percentage of the older population in Cambodia was 8.86 . The Plain region had the largest proportion than the other three natural regions ( $9.77 \%$ ), as seen in Figure 9. Percentages of older population were $8.42 \%$ and $8.01 \%$ for Tonle Sap Region and Coastal Region, respectively. In Plateau and Mountain Region, the share was $6.95 \%$, which was the lowest among all natural regions. In Plain Region, Kampong Cham and Prey Veng have greater proportions of the elderly than other provinces ( $11.66 \%$ and $11.40 \%$, respectively). The share of those aged 60 years and older was relatively low in Phnom Penh (7.96\%). In the following decade, generally, percentages of the older population are projected to further increase in all natural regions and provinces in Cambodia. Proportions of the older people by age group and sex across natural regions and provinces are shown in Table A14.

Table 7. Distribution of older population in Cambodia, Natural Regions and Provinces, 2019

| Cambodia/Natural Regions/Provinces | Male |  | Female |  | Total |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number | Percent | Number | Percent | Number | Percent |
| Cambodia | 549,481 | 100.00 | 829,207 | 100.00 | 1,378,688 | 100.00 |
| Plain Region | 293,396 | 53.40 | 453,165 | 54.65 | 746,561 | 54.15 |

Figure 9. Proportion of Old People in Cambodia, Natural Regions and Provinces, 2019-2030

Figure 10. Index of Ageing in Cambodia, Natural Regions, and Provinces, 2019

### 4.2 Index of Ageing

The index of ageing is the percentage of number of population aged $60+$ to the number of the population aged 0-14.

As shown in Figure 10, in 2019, the index of ageing in Cambodia was 30.16, with about 30 older persons for every 100 children below the age of 15 years. The index of ageing in the Plain Region was 35.36, much higher than Tonle Sap Region (26.53), Coastal Region (29.44), and Plateau and Mountain Region (21.91). In the next decade, the index of ageing in Cambodia will increase further. In 2030, the index of ageing in Cambodia will be 51.56. In the Plain Region, the index of ageing will increase to 60.64 in 2030, with about 64 older people for every 100 children below the age of 15 years (Table A15).

### 4.3 Median Age

From 2008 to 2019, the median age for Cambodia increased from 21.9 years to 26 years (Table A16). For women, the median age was 27 years, higher than their male counterparts (25 years). More specifically, the median age increased from 21 to 27 years in the Plain Region, from 20.9 to 25 years in the Tonle Sap Region, from 21 to 27 years in the Coastal Region, and from 20.3 to 24 years in the Plateau and Mountain Region over the past decade. In the Plain Region and Coastal Region, median ages were higher than in the Tonle Sap Region and Plateau and Mountain Region. The increasing median age in Cambodia further indicates the shift in the distribution of the country's population towards older ages.

The diminishing total fertility rate (decline from 2.7 children per woman in 2008 to 2.5 children per woman in 2019 [7]), and the improving life expectancy (male and female life expectancy increased by 13.49 and 13.14 years, respectively between 2008 and 2019 [6, 7]) shaped the population age structure in Cambodia. Population ageing is becoming an outstanding challenge in many younger countries in the Western Pacific Region, including Cambodia [8]. Population pyramids in Figure 11 further reflect that the future demographic changes will vary across different natural regions and places of residence.

## Chapter 5 <br> Disabilities in Older People

Six types of disabilities were reported in the 2019 Cambodia census, including (1) in seeing, (2) in hearing, (3) in walking, (4) in remembering/concentrating, (5) in self-care, and (6) in using usual language. Disabilities are defined as those areas of life having some/major/full difficulties in seeing, hearing, walking, remembering/concentrating, self-care or using usual language.

Table 8. Percentage of distribution of Elderly Disability, among population aged $60+$, by categories, sex and place of residence, Cambodia, 2019

| Sex/Place of Residence | Category of Disability |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | In <br> Seeing | In <br> Hearing | In <br> Walking | In Remembering/ Concentrating | In <br> Self-care | In <br> Using usual language |
| Males |  |  |  |  |  |  |  |
| Urban | 13.11 | 16.49 | 13.85 | 13.64 | 12.88 | 10.96 | 10.74 |
| Rural | 16.65 | 20.22 | 17.77 | 17.24 | 16.67 | 14.03 | 13.94 |
| Females |  |  |  |  |  |  |  |
| Urban | 16.88 | 20.08 | 17.63 | 17.73 | 16.75 | 14.63 | 14.47 |
| Rural | 20.75 | 24.05 | 21.78 | 21.65 | 20.93 | 18.14 | 17.96 |

In $2019,16.88 \%$ and $20.75 \%$ of the old women in Cambodia reported having disabilities in engaging in activities mentioned above in urban and rural areas respectively, higher than their male counterparts ( $13.11 \%$ in the urban area and $16.65 \%$ in the rural area) (Table 8). For all activities, older women were found to have higher reported levels of suffering from disabilities regardless of the place of residence. Older people in the rural area were more likely to report disabilities than those living in the urban area. Table A17 shows the detailed percentages of older people with disabilities in different natural regions and provinces.

## Chapter 6 <br> Economic characteristics of older people

### 6.1 Usual Activity Status of the Older People aged 60+ years old

Economically active older people include those who were employed and unemployed. Not economically active people include homemakers, students, dependent rent receivers, retired or other income recipients, and others who are not economically active for most of the time and who do not come under any of the above mentioned categories.

Table 9. Distribution of Older Population (Percent) by Usually Activity Status, Sex and place of residence, Cambodia, 2019

| Sex/ | Usually Active Status |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Place of Residence | Total | Employed | Unemployed | Not Economically Active |
| Males |  |  |  |  |
| Urban | 100 | 60.26 | 1.74 | 38.00 |
| Rural | 100 | 77.19 | 1.54 | 21.27 |
|  |  |  |  |  |
| Females | 100 | 36.83 | 2.05 | 61.12 |
| Urban | 100 | 59.08 | 1.76 | 39.16 |
| Rural |  |  |  |  |

For both sexes, the employment rates of the older population in the rural area were higher than that in the urban area in 2019 in Cambodia (Table 9), which may be attributable to the higher participation in farm labour in the rural area. In both urban and rural areas, the employed rates of older men was higher than older women. Unemployment rates were low in urban as well as rural areas. The not economically active rates for older men were lower than their female counterparts in both urban and rural areas. This pattern of economic characteristics of the older population applied to all the natural regions of Cambodia, which could be seen in Table A18.

### 6.2 Status in Employment

The analysis of the status in employment of older people shows that older people with own account accounted for a substantial proportion of the total number of male older workers in Cambodia, particularly in the rural area. In $2019,81.64 \%$ of the total older men in the rural area reported themselves as own account workers, much higher than that in the urban area ( $64.32 \%$ )
(Table 10). Apart from own account workers, about $25.89 \%$ of older men in the urban area identified themselves as paid employees. For old women, $53.39 \%$ and $52.7 \%$ reported themselves as own account workers, much lower than their male counterparts, especially in the rural area, where unpaid family workers constituted about $41.66 \%$ of the total female old population. Employers, however, accounted for a tiny proportion among both male and female old people in urban as well as rural areas. These economic characteristics were similar across natural regions of Cambodia (Table A19).

Table 10. Distribution of Older Population (Per cent) by employment status, sex and place of residence, Cambodia, 2019

| Sex/Place of Residence | Status in employment |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | Employer | Paid <br> Employee | Ownaccount worker | Unpaid <br> Family <br> worker | Other | Not State |
| Males |  |  |  |  |  |  |  |
| Urban | 100 | 1.18 | 25.89 | 64.32 | 5.27 | 0.28 | 3.05 |
| Rural | 100 | 0.58 | 7.16 | 81.64 | 8.96 | 0.33 | 1.33 |
| Female |  |  |  |  |  |  |  |
| Urban | 100 | 0.63 | 10.51 | 53.39 | 27.70 | 0.21 | 7.58 |
| Rural | 100 | 0.35 | 2.54 | 52.70 | 41.66 | 0.09 | 2.67 |

### 6.3 Occupation of the Older Population

The most common occupation for the older population in Cambodia was 'skilled agricultural, forestry and fishery workers', especially in the rural areas. In 2019, about $67.26 \%$ of old men and $54.81 \%$ of old women in the rural area engaged in this category of occupation, much larger number than that in the urban area ( $28.53 \%$ of old men and $21.67 \%$ of old women), as shown in Table 11. 'Services and sales workers' was another main category of occupation that older people engaged in the urban area ( $11.18 \%$ for old men and $10.07 \%$ for old women), but in the rural area, the proportions were relatively low for both sexes. Other categories, however, accounted for a very limited proportion among the old population in Cambodia.

Table 11. Distribution of occupation of older population in Cambodia, 2019

| Occupation | Urban |  |  |  | Rural |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Notes: $m(x, n)=$ Age-specific central death rate.
$a(x, n)=$ Average person-years lived by those who die between ages $x$ and $x+n$
$n q x=$ Probability of dying between exact ages $x$ and $x+n$ (age-specific mortality rate)
$l(x)=$ Number of survivors at age $x$.
$n d x=$ Number of deaths occurring between ages $x$ and $x+n$.
$n L x=$ Number of person-years lived between ages $x$ and $x+n$.
$5 S x=$ Survival ratio for persons aged $x$ to $x+5$ surviving 5 years to ages $x+5$ to $x+10=5 L x+5 / 5 L x$
$T x=$ Number of person-years lived after age $x$.
$e(x)=$ Life expectancy at age $x$.

As shown in Table 12 and Table 13, life expectancy at birth for men was 74.3 years in 2019, and for women, life expectancy at birth was 76.8 years [7]. These numbers were much higher than those in 2008 ( 60.81 years for men and 63.66 years for women) [6], meaning that Cambodia has achieved substantial progress in improving people's health conditions over the past decade.

In the preceding 12 months from the 2019 Census, as shown in Table 14, key causes of death for the older population in Cambodia were fever, heart disease, tuberculosis, diarrhea, and other illnesses. For both sexes, other illnesses that were not specified in the census accounted for the largest proportions ( $49.3 \%$ for old men and $32.2 \%$ for old women, respectively). Generally, old women had greater proportions in causes such as diarrhea, dengue fever, malaria, and particularly fever, which caused $18.9 \%$ of all old female deaths. For old men, proportions of causes such as tuberculosis, heart disease, and road accidents were much larger than their female counterparts $(8.2 \%, 15.8 \%, 1.9 \%$ for old men and $7.3 \%, 9.8 \%, 0.6 \%$ for old women).

Table 14. Causes of death among the older population in Cambodia, 2019

| Cause of Death | Male | Female | Total |
| :--- | :--- | :--- | :--- |
| Fever | $9.1 \%$ | $18.9 \%$ | $15.3 \%$ |
| Diarrhea | $5.7 \%$ | $6.8 \%$ | $6.4 \%$ |
| Tuberculosis | $8.2 \%$ | $7.3 \%$ | $7.6 \%$ |
| Heart Disease | $15.8 \%$ | $9.8 \%$ | $12.0 \%$ |
| Dengue Fever | $3.0 \%$ | $7.1 \%$ | $5.6 \%$ |
| Malaria | $2.0 \%)$ | $4.9 \%$ | $3.9 \%$ |
| Tetanus | $2.0 \%$ | $4.8 \%$ | $3.8 \%$ |
| HIV/AIDS | $0.7 \%$ | $2.3 \%$ | $1.7 \%$ |
| Other Illnesses | $49.3 \%$ | $32.2 \%$ | $38.4 \%$ |
| Land Mine | $0.3 \%$ | $0.1 \%$ | $0.1 \%$ |
| Road Accident | $1.9 \%$ | $0.6 \%$ | $1.1 \%$ |
| Drowning | $1.1 \%$ | $2.5 \%$ | $2.0 \%$ |
| Not Stated | $0.7 \%$ | $2.7 \%$ | $2.0 \%$ |
| Total | $100.0 \%$ | $100.0 \%$ | $100.0 \%$ |

Urban and rural areas in Cambodia shared similar patterns (Table 15). In the preceding 12 months from the 2019 Census, for both areas, 'other illnesses' were the major causes of death for old men as well as women, especially in the rural area (40.3\%), somewhat larger than that in the urban area ( $35.0 \%$ ). The percentages were much greater among old men ( $49.8 \%$ in the urban area and $49.1 \%$ in the rural area, respectively) than those among old women ( $27.8 \%$ in the urban area and $34.8 \%$ in the rural area, respectively). Fever also caused many deaths in both urban and rural areas, only secondary to those causes of death that were not specified, particularly for old women. In the urban area, the proportion of old women was $20.2 \%$, larger than their male counterparts $(7.8 \%)$. This was also applicable to the rural area ( $18.2 \%$ for old women and $9.6 \%$ for old men,
respectively). Other causes of death such as heart disease, diarrhea, and tuberculosis also had important impacts on old population's health in Cambodia, which needs to be further addressed in the future policy implementation.

Table 15. Causes of death among the older population by sex and place of residence in Cambodia, 2019

| Cause of Death | Urban |  |  | Rural |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Male | Female | Total | Male | Female | Total |
| Fever | 7.8\% | 20.2\% | 16.1\% | 9.6\% | 18.2\% | 14.9\% |
| Diarrhea | 7.1\% | 7.2\% | 7.2\% | 5.1\% | 6.5\% | 6.0\% |
| Tuberculosis | 7.5\% | 6.9\% | 7.1\% | 8.6\% | 7.5\% | 7.9\% |
| Heart Disease | 15.2\% | 9.3\% | 11.3\% | 16.1\% | 10.0\% | 12.3\% |
| Dengue Fever | 3.1\% | 8.1\% | 6.4\% | 3.0\% | 6.5\% | 5.2\% |
| Malaria | 2.7\% | 5.9\% | 4.9\% | 1.7\% | 4.4\% | 3.3\% |
| Tetanus | 1.5\% | 5.6\% | 4.3\% | 2.3\% | 4.4\% | 3.6\% |
| HIV/AIDS | 0.6\% | 2.7\% | 2.0\% | 0.7\% | 2.1\% | 1.6\% |
| Other Illnesses | 49.8\% | 27.8\% | 35.0\% | 49.1\% | 34.8\% | 40.3\% |
| Land Mine | 0.2\% | 0.1\% | 0.1\% | 0.3\% | 0.1\% | 0.2\% |

| Drowning | 1.0\% | 2.9\% | 2.3\% | 1.2\% | 2.2\% | 1.8\% |
| Not Stated | 0.9\% | 2.6\% | 2.0\% | 0.7\% | 2.7\% | 1.9\% |
| Total | 100.0\% | 100.0\% | 100.0\% | 100.0\% | 100.0\% | 100.0\% |

## Chapter 8

## Conclusion

Since 1990s, Cambodia has made substantial progress in improving people's health status. In 2008-2019, infant mortality rate in Cambodia declined from 26 deaths per 1,000 live births to 18 [7]. Meanwhile, life expectancy at birth increased obviously. Between 1998 and 2019, male life expectancy at birth increased from 54 years to 74.3 years, and for women, life expectancy at birth rose from 58 years to 76.8 years [5, 7]. Besides, the total fertility rate in Cambodia declined from 2.7 children per woman in 2008 to 2.5 in 2019 [7]. These caused the rapid ageing of population in Cambodia as that happens in some other societies in the Western Pacific region [8], which is the focus of report.

Population ageing has deep social, economic, and political implications for Asia-Pacific region [9]. Cambodia, a least developed countries in this region, also confronts ageing-related challenges such as shortage of social pension support and high proportion of out-of-pocket expenditure of private household to the total health-care expenditure [9]. Rapid ageing process in the following decades will inevitably aggregate the burden of social-economic development in Cambodia, particularly as Cambodia is aiming to become an upper-middle income country by 2030 and a high-income country by 2050 [10]. More importantly, the distribution of disabilities by different category reported here suggests that people in Cambodia live longer, but may not necessarily live healthier, as mentioned in previous United Nations report (in Cambodia, the older population will spend an estimated seven years with a disability, which is about 40 percent of their remaining life, despite the increases in both overall life expectancy and healthy life expectancy after age 60 years [9]). Therefore, forward-looking strategies, e.g., more investment in health-care systems are imperative in view of the challenging ageing issues in the coming decades.

The Royal Government of Cambodia produced an ageing policy report in 2017 ("National Ageing Policy for 2017-2030") aiming at further improving the wellbeing of older people in Cambodia, which is proactive, careful and thoughtful [5]. Within it, policies that have been developed are congruent with the principles of United Nation ESCAP's report on "Addressing the Challenges of Population Ageing in Asia and the Pacific" [9] and the World Health Organization's Regional Action Plan on Healthy Ageing, which includes a strong focus on financial security, health and well-being, living arrangements, enabling environment, active ageing, intergenerational activities, elder abuse, and care during emergency situations [8]. This is a very
thorough policy that was made through inter-ministerial engagement and agreement. Having such a solid foundation in ageing policy in Cambodia, some recommendations can be considered for further improvement, including:

First, further strengthening healthy ageing policies in Cambodia. Comprehensive policies and concrete action initiatives on health care for the older population can provide practical guidance to service providers to take care of them and help them obtain a better quality of life. Effective implementation of healthy ageing measures requires multisectoral collaboration. The Royal Government of Cambodia plays a crucial role in formulating policies to address ageingrelated challenges and strengthening the coordination between concerned ministries-agencies and stakeholders in Cambodia. Besides, regular evaluation of the existing policies for ageing population will also be very important. Periodic examination can assess the achievements/progress and detect potential challenges, which will provide evidence for the further improvement of policies.

Second, taking sex- and region- differences in demographic shift into account when developing ageing-related strategies. In Cambodia, population ageing varies across sexes, natural regions, provinces, as well as places of residence. Compared with other natural regions, the Plain Region is facing relatively faster demographic changes partly because it is more economically and socially developed. Even within the region, the diverse extent of ageing process can be observed in different provinces. In the capital city - Phnom Penh, despite the lower proportion of the older people to the total population in Cambodia, the larger number of older people compared with other provinces in the Plain Region still implied more healthcare demands are needed. Besides, population ageing does not happen in a balanced pace between urban and rural areas, with the latter having larger proportion of population aged 60 years and over. Therefore, the government commitment aiming at coping with the population ageing challenges in the Cambodian society should also vary by regional difference in demographic shift.

Third, re-orienting health care systems to address the changing health care needs due to population ageing. As older people have greater health and long-term care demands than younger people, rapid ageing in Cambodia calls for more health investments in the coming decades so as to meet the rising demands of the older people. Formal establishment of the specialty of geriatric medicine and gerontological nursing will be a very meaningful approach as it educates specialised healthcare practitioners, thus providing human support for the elderly services. More training of health and social care professionals on ageing issues is also necessary. Besides, the use of technology can be regarded as an opportunity to benefit the elderly to improve their physical and
mental health, as well as their social lives. By providing technology training courses, programmes and learning hubs that are customized to the older people's needs, the government can help to bridge the digital divide by addressing differences in educational background and information and communications technology skills of older population [11].

Fourth, focusing on maintaining intrinsic capacity and functional ability among the older population. By the age of 60 years, apart from non-communicable diseases such as heart disease, stroke and cancer, age-related losses in hearing, seeing and moving are also important drivers for the major burdens of disability and death [12]. More composite health response that aims at improving the older people's intrinsic capacity will be principle to promote healthy ageing. Recommendations on Integrated Care for Older People, namely, ICOPE, which were provided by WHO [12], can also be an important instruction for the implementation of ageing-related programmes at the community level in Cambodia. Systematic training of health care professionals on ageing issues, e.g., recognizing and managing impairments in older ages, will be of crucial significance for the prevention of capacity declines among the elderly. Enhancement of the pivotal role of health centres in the community is critical for improving accessibility and availability of health care services, and also crucial for healthier ageing within the community. Besides, providing support (financial and/or training) to caregivers of older population will also be principal as it can have positive impacts on the care burden.

Last but foremost, population ageing can be seen as an opportunity, not necessarily being a negative situation, or considered as a challenge or problem [13]. It provides chances to rethink healthy policy for the benefit of all-old and young [13]. Responses to population ageing should recognize the contributions that older population make to society. Promoting the employment of older worker will be an effective way for promoting old people's participation in economic and social activities, and also help relieve the financial burden of pension schemes. Besides, as education plays an important role in addressing the challenges of population ageing [11], the relatively low level of education among the older population highlights the necessity to promote education expansion in Cambodia, covering life-long learning among older persons as well as education-investing in young people today. In addition, as suggested by WHO [8], building a friendly environment is also crucial for healthy ageing in Cambodia.

Further improvements (which often are the foci of international action plans, such as ref. [8] and [9], include:
-Promote healthier ageing within the community
-Provide support (financial and/or training) to caregivers of older people who are in need of care, in an effort to keep older people living in the community/at home as long as possible
-Enhance the concept of healthy aging in the rural older population
-Enhance social participation of older people
-Provide social protection and security to older people
-Promote research in aspects of health and social care (and its interface) of older people
-Address issues of isolation in urban (mass housing in cities) or rural (lack of social engagement opportunities) areas
-Strengthen healthy ageing programmes
-Improve access for older people to medicines and assistive devices
-Address functional limitations from a preventative perspective
-Address issues around COVID-19 particularly in the older population, which is most vulnerable to the virus
-Promote a more gender-equal society and recognise that older people are not a homogeneous group. Consider older people as an investment in human capital and a better future for the country.
-Continue to approach ageing issues based on a life course model
-Address poverty issues within the older population, particularly in rural areas
-Enhance longer-term care options for those older people with more complex needs
-Encourage interdisciplinary collaboration (doctors, nurses, social workers, community workers) to provide age-friendly environment in the community.
-Provide support/services for older people with disabilities, particularly in rural areas.
-Develop health education on fever treatment and heart disease prevention.

In conclusion, given the rapid population ageing in Cambodia in the following decades, incorporating ageing issues into national development plans should be strongly suggested. Forward-looking strategies, for instance, more financial investments in health care systems, and fostering age-friendly environment are imperative for better preparation for the impacts of
demographic shift in the future in Cambodia. Both micro and macro levels need to be considered on how we can address social participation, social determinants of health, the burden of noncommunicable diseases, and how we can apply technology to the benefit of older people or develop models of care that meet the needs of older people and enhance healthy aging [14].
