Directorate General for Health Ministry of Health Phnom Penh, Cambodia

June 2022

The 2021–22 Cambodia Demographic and Health Survey (2021–22 CDHS) was implemented by the National Institute of Statistics (NIS) in collaboration with the Ministry of Health. ICF provided technical assistance through The DHS Program, a USAID-funded project providing support and technical assistance in the implementation of population and health surveys in countries worldwide.

Additional information about the 2021–22 CDHS may be obtained from the National Institute of Statistics, 386 Monivong Boulevard, Sangkat Beong Keng Kang 1, Chamkar Mon, Phnom Penh, Cambodia; Telephone: (855) 23-213650; E-mail: linahang2002@gmail.com; Internet: www.nis.gov.kh, or from the Directorate General for Health, Ministry of Health 80 Samdech Penn Nouth Boulevard (289), Sangkat Boeungkak 2, Tuol Kork, Phnom Penh, Cambodia; Telephone: (855) 23-885970/23-884909; E-mail: webmaster@moh.gov.kh; Internet: www.moh.gov.kh.

Information about The DHS Program may be obtained from ICF, 530 Gaither Road, Suite 500, Rockville, MD 20850, USA (telephone: +1-301-407-6500; fax: +1-301-407-6501; email: info@DHSprogram.com; internet: www.DHSprogram.com).

The contents of this report are the sole responsibility of NIS and ICF and do not necessarily reflect the views of USAID, the United States Government, or other donor agencies.

FOREWORD

The 2021–22 Cambodia Demographic and Health Survey (CDHS) was implemented by the National Institute of Statistics (NIS) and the Ministry of Health (MoH). This Key Indicators Report (KIR) presents a first look at selected findings from the 2021–22 CDHS. Findings in this report will be used by policymakers to evaluate the demographic and health status of the Cambodian population to formulate appropriate population and health policies and programs in Cambodia. The forthcoming final report will contain more detailed findings.

The survey received financial support from the Royal Government of Cambodia (RGC), the United States Agency for International Development (USAID), the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ), Australian Aid, the United Nations Population Fund (UNFPA), the United Nations Children's Fund (UNICEF), and the World Food Programme (WFP). We would like to thank ICF for technical assistance throughout the survey. The survey could also not have been successfully carried out without the dedication of the staff of the NIS and the MoH who planned, oversaw, and participated in the entire CDHS. Special thanks go to the fieldworkers who made this survey possible by contributing their valuable time.

We would like to extend our special thanks to Kitti Settha Pandita Chhay Than, Honorable Senior Minister, Minister of Planning; H.E. Prof. Eng Huot, Secretary of State, Ministry of Health; H.E. Leng Phally, Secretary of State, Ministry of Planning; H.E. Hor Darith, Secretary of State, Ministry of Planning; and other members of the Executive Committee and Technical Committee who contributed to the successful implementation of the survey. We greatly appreciate the work carried out by all NIS and MoH staff at the central and provincial offices who worked with dedication and enthusiasm to make the survey a success. Finally, we would like to express our special thanks to the local authorities involved and to the survey respondents who gave their valuable time to make the survey possible.

Delegate of Royal Government of Cambodia in-charge Director General of the National Ins titute of Statistics , Ministry of Planning

Her Excellency Hang Lina

Secretary of State, Ministry of Health

His Excellency Dr. Lo Veasnakiry

1 INTRODUCTION

The 2021–22 Cambodia Demographic and Health Survey (CDHS) is the fifth Demographic and Health Survey (DHS) conducted in Cambodia, following those implemented in 2000, 2005, 2010, and 2014. The National Institute of Statistics (NIS), in collaboration with the Ministry of Health (MoH), implemented the survey. Data collection took place from September 15, 2021, to February 15, 2022. Funding for the 2021–22 CDHS was provided by the Royal Government of Cambodia (RGC), the United States Agency for International Development (USAID), the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ), Australian Aid, the United Nations Population Fund (UNFPA), the United Nations Children's Fund (UNICEF), and the World Food Programme (WFP). ICF provided technical assistance through The DHS Program, which assists countries in collecting data to monitor and evaluate population, health, and nutrition programs.

This Key Indicators Report presents a first look at selected findings from the 2021–22 CDHS. A comprehensive analysis of the data will be presented in a final report in the fourth quarter of 2022.

1.1 SURVEY OBJECTIVES

The primary objective of the 2021–22 CDHS is to provide up-to-date estimates of basic demographic and health indicators. Specifically, the 2021–22 CDHS collected information on fertility, awareness and use of family planning methods, breastfeeding practices, nutritional status of women and children, maternal and child health, adult and childhood mortality, women's empowerment, domestic violence, awareness and behavior regarding HIV/AIDS and other sexually transmitted infections (STIs), and other health-related issues such as smoking.

The information collected through the 2021–22 CDHS is intended to assist policymakers and program managers in designing and evaluating programs and strategies for improving the health of the country's population. The 2021–22 CDHS also provides indicators relevant to the Sustainable Development Goals (SDGs) for Cambodia.

2 SURVEY IMPLEMENTATION

2.1 SAMPLE DESIGN

he sampling frame used for the 2021–22 CDHS is the 2019 General Population Census (GPC) of Cambodia, which was conducted in 2019 by the NIS. The sampling frame is a complete list of enumeration areas (EAs) covering the whole country, provided by the NIS, the implementing agency for the CDHS. An EA is a natural village—or a part of a village—created for the 2019 GPC and that served as the counting unit for the census.

The 2021–22 CDHS followed a two-stage sample design and was intended to allow estimates of key indicators at the national level as well as for urban and rural areas, and for each of Cambodia's 25 provinces. The first stage involved the selection of sample points (clusters) consisting of EAs delineated for the 2019 GPC. A total of 709 clusters were selected, 241 in urban areas and 468 in rural areas. (The 2019 GPC had reclassified about 20% of rural EAs as urban EAs.)

The second stage involved the systematic sampling of households. A household listing operation was undertaken in all selected EAs from April to August 2021, and households to be included in the survey were randomly selected from these lists. Thirty households were selected from each cluster, for a total sample size of 21,270 households. Because of the approximately equal sample sizes in each province, the sample is not self-weighting at the national level, and weighting factors have been calculated and added to the data file so that the results will be proportional at the national level.

All women age 15–49 who were either permanent residents of the selected households or visitors who stayed in the household the night before the survey were eligible to be interviewed. In half of the households, all men age 15–49 who were either permanent residents of the selected households or visitors who stayed in the household the night before the survey were eligible to be interviewed. In the subsample of households not selected for the male survey, height, weight, and mid-upper arm circumference measurements were performed among women age 15–49 and children under age 5.

2.2 QUESTIONNAIRES

Five questionnaires were used for the 2021–22 CDHS: the Household Questionnaire, the Woman's Questionnaire, the Man's Questionnaire, the Biomarker Questionnaire, and the Fieldworker Questionnaire. The questionnaires, based on The DHS Program's standard Demographic and Health Survey (DHS-8) questionnaires, were adapted to reflect the population and health issues relevant to Cambodia. Comments were solicited from various stakeholders representing government ministries and agencies, nongovernmental organizations, and development partners. The survey protocol was reviewed by the Cambodia National Ethics Committee for Health Research and the ICF Institutional Review Board. After all questionnaires were finalized in English, they were translated into Khmer. The 2021–22 CDHS used computer-assisted personal interviewing (CAPI) for data collection.

The Household Questionnaire listed all members of and visitors to selected households. Basic demographic information was collected on each person listed, including age, sex, marital status, education, and relationship to the head of the household. For children under age 18, survival status of parents was determined. Data on age, sex, and marital status of household members were used to identify women and men who were eligible for individual interviews. The Household Questionnaire also collected information on characteristics of the household's dwelling unit, such as source of drinking water; type of toilet facilities; materials used for flooring, external walls, and roofing; and ownership of various durable goods. In addition, modules on disability and child discipline were added to this questionnaire.

The Woman's Questionnaire was used to collect information from all eligible women age 15–49. These women were asked questions on the following topics:

- Background characteristics (including age, education, and media exposure)
- Pregnancy history and child mortality
- Knowledge, use, and source of family planning methods
- Antenatal, delivery, and postnatal care
- Vaccinations and childhood illnesses
- Breastfeeding and infant feeding practices
- Women's minimum dietary diversity
- Marriage and sexual activity
- Fertility preferences (including desire for more children and ideal number of children)
- Women's work and husbands' background characteristics
- Knowledge, awareness, and behavior regarding HIV/AIDS and other sexually transmitted infections (STIs)
- Knowledge, attitudes, and behavior related to other health issues (for example, smoking)
- Adult and maternal mortality
- Domestic violence

The Man's Questionnaire was administered to all men age 15–49 in the subsample of households selected for the men's survey. The Man's Questionnaire collected much of the same information as the Woman's Questionnaire but was shorter because it did not contain a detailed reproductive history or questions on maternal and child health.

The Biomarker Questionnaire was used to record the results of anthropometry measurements for women and children. This questionnaire was administered only to the subsamples selected for the respective biomarker component.

The Fieldworker Questionnaire recorded background information from the interviewers that will serve as a tool in conducting analyses of data quality. Each interviewer completed the self-administered Fieldworker Questionnaire after the final selection of interviewers and before the fieldworkers entered the field. No personal identifiers were attached to the 2021–22 CDHS fieldworkers' data file.

The interviewers used tablet computers for data collection. The tablet computers were equipped with Bluetooth® technology to enable remote electronic transfer of files, such as assignments from the team supervisor to the interviewers, individual questionnaires to survey team members, and completed questionnaires from interviewers to team supervisors. The CAPI data collection system employed in the 2021–22 CDHS was developed by The DHS Program with the mobile version of CSPro.

2.3 ANTHROPOMETRY MEASUREMENT

Weight measurements were taken using mother/child scales with a digital display (UNICEF—model number S0141025). Height and length were measured using a portable baby/adult length-height measurement system (UNICEF—model number S0114540). Children younger than age 24 months were measured lying down (recumbent length), while older children and women were measured standing (height). Mid-upper arm circumferences (MUAC) were measured using new standard MUAC Tape (UNICEF—model number S0145620).

To assess the precision of height measurements, about 10% of children were randomly selected to be measured a second time. The DHS Program defines a difference of less than 1 centimeter between the two height measurements as an acceptable level of precision. Children with a Z-score of less than -3 or more than 3 for height-for-age, weight-for-height, or weight-for-age were flagged and measured a second time. The re-measurement of flagged cases was performed to ensure accurate reporting of height and weight measurements.

2.4 PRETEST

The pretest for the CDHS was implemented June 2 to 28, 2021. The first 2 weeks were allocated for paper questionnaire training, followed by 3 days for CAPI training, and 2 days for field practice. The ICF technical assistance was provided virtually.

2.4.1 Questionnaire training

Thirty candidates participated in questionnaire training—13 females and 17 males (20 interviewers, five supervisors and five biomarker technicians). Five NIS coordinators and one ICF staff member conducted the questionnaire training. The anthropometry measurement training was conducted separately by UNICEF—and in parallel to the questionnaire training—for five technicians. All 30 candidates were expected to return to participate in the main survey.

The training was conducted in Khmer. Mock interviews were organized at the end of training. Each trainee completed one household questionnaire and two individual questionnaires. The data collected during the practice exercises were later used in training sessions to test the CAPI programs and to practice collecting data on the tablets. Coordinators from the Ministry of Health provided training on various health topics including nutrition, HIV/AIDS, child vaccinations, and family planning and reproductive health.

The training of trainers for CAPI was conducted June 16 to 22, 2021, for five NIS staff, and the CAPI pretest training was conducted June 23–25, 2021, for 30 participants including the biomarker technicians.

Interviewers and biomarker technicians conducted a two-day fieldwork practice to solidify skills learned during the pretest training, and to provide a simulated fieldwork experience to test survey materials. The participants worked in five teams that mirrored the team composition planned for the actual fieldwork (one supervisor, four interviewers, and one biomarker technician). The practice was carried out in five villages in Kompong Thom province. Twenty-four households were selected in each village for the teams to collect data from during the field practice. In total, 78 households, 58 women, and 61 men were interviewed.

2.5 TRAINING OF FIELD STAFF

2.5.1 Questionnaire training

The main training for the 2021–22 CDHS was organized at the Ministry of Planning main auditorium in Phnom Penh. One hundred twenty-five candidates participated in the training—100 interviewers and 25 team supervisors. All candidates participated in the questionnaire training from July 19 to 31, 2021. Two National Institute of Statistics (NIS) coordinators and one ICF staff member conducted the questionnaire training. About half of the participants had worked on previous rounds of the CDHS or on other surveys, while the rest had no survey experience. Forty percent (50) of these participants were from provincial health departments, another 40% (50) were from the provincial statistics departments, and 20% (25) were from NIS.

Mock interviews were organized at the end of training. Each trainee completed one household questionnaire and two individual questionnaires. The data collected during the practice exercises were later used in training sessions to test the CAPI programs and to practice collecting data on the tablets. Representatives from developing partners and from various departments of the Ministry of Health and Women Affairs attended the training via Zoom. They took part online, discussing topics related to child health and early childhood development, family planning and reproductive health, HIV/AIDS, nutrition, immunization, and domestic violence.

A significant challenge for the survey was that the training participants were selected by MoH and NIS/Ministry of Planning from their provincial departments. So, most of the participants met expected qualifications, including experience in using computers and in working on a survey. As only the exact numbers needed to form the planned teams were allowed to be trained, there were no backup interviewers.

2.5.2 Anthropometry training

The anthropometry training was conducted by nutritionists from the MoH. Because of UNICEF's Covid-19 risk mitigation policy, UNICEF Cambodia could not participate. Covid-19 restrictions also prevented the women and children required for the anthropometry practice and standardization from coming into the NIS building. And, for the same reason, meetings and gatherings at community centers for anthropometry practice and standardization did not take place. Practice on measuring adults was done with interviewers and volunteered NIS staff.

2.5.3 CAPI training

The CAPI training was done from August 2 to 21 with in-person and virtual technical assistants. The CAPI training took longer than usual because a Covid-19 incident happened within the IT department at the end of the first week of training. Large gatherings were no longer permitted, and so participants were split into four small groups. Two groups were trained during the day, one from 8:00 a.m. to 12:30 p.m. and another from 1:30 p.m. to 5:30 p.m. It took 2 days to present each remaining topic on the agenda. The CAPI system was translated into Khmer and this included questions, response categories, error messages, reports, menus, and so on. The translations and checking were done by ICF and the NIS staff. The Household, Woman's, Man's, and Biomarker questionnaires, as well as the interviewer and supervisor's CAPI system, were also translated into Khmer.

The participants were grouped into 25 teams, each consisting of a team supervisor and four interviewers. Participants learned how to record responses in the CAPI system and how to use Bluetooth to exchange assignments and transfer questionnaire data and updates for the CAPI system. Supervisors also learned how to use an internet connection and the Internet File Streaming System (IFSS) to send data to the central office and to upload CAPI system updates into their tablets.

Because of Covid-19 regulations, field practice could not be implemented after the classroom training was completed, Instead, interviewers were asked to collect data at home and in their neighborhoods. This enabled participants to complete the training curriculum and gain experience on how to use the CAPI system for data collection and for closing the cluster. Clusters had been created for this improvised method—one cluster per team, and each cluster with five households. Each team interviewer and team supervisor interviewed at least one household using the Household Questionnaire and, using the appropriate Individual Questionnaire, all eligible adults who were the same gender as the interviewer. Biomarker questionnaires were also completed and keyed into the CAPI system. This kind of field practice would not normally replace conventional field practice. Nonetheless, under the circumstances, it was very helpful and the training was successfully completed. The workaround ensured that one of the most important aspects of the training was accomplished.

2.6 FIELDWORK

Data collection was carried out by 25 field teams. Each team was provided a driver and a four-wheel drive vehicle. Coordinators from NIS and MoH coordinated and supervised fieldwork activities. ICF provided virtual technical assistance during the data collection period. The fieldwork began on September 15, 2021, in all 25 provinces, with each field team responsible for one province. The teams were closely monitored for quality control by the five field coordinators. There were instances when teams had to change their planned routing or to pause the field activities due to Covid-19 outbreaks in their provinces. Data collection was completed on February 15, 2022.

Fieldwork monitoring was an integral part of the 2021–22 CDHS and was carried out during field data collection by NIS, MoH, and virtually by ICF. NIS and MoH coordinators were equipped with monitoring guidelines. Every week NIS and ICF generated field check tables from the completed interview data to monitor data quality and fieldwork progress. Feedback was regularly provided to the coordinators and the field teams.

2.7 DATA PROCESSING

The processing of the 2021–22 CDHS data began as soon as the fieldwork started. When data collection was completed in each cluster, the electronic data files were transferred via the internet file streaming system (IFSS) to the NIS central office in Phnom Penh. The data files were registered and checked for inconsistencies, incompleteness, and outliers. Errors and inconsistencies were communicated to the field teams for review and correction. Secondary editing, done by NIS data processors, was carried out in the central office, and included resolving inconsistencies and coding the open-ended questions. The paper Biomarker Questionnaires were collected by field coordinators and then compared with the electronic data files to look for any inconsistencies arising during data entry. Data processing and editing were carried out using the CSPro software package. The concurrent data collection and processing offered an advantage because it maximized the likelihood of the data being error-free. Timely generation of field check tables allowed for effective monitoring. The secondary editing of the data was completed in March 2022.

Numbers in the tables throughout this report reflect weighted numbers. Percentages based on 25 to 49 unweighted cases are shown in parentheses. Percentages based on fewer than 25 unweighted cases are suppressed and replaced with an asterisk. This is to caution readers when interpreting data that a percentage based on fewer than 50 cases might not be statistically reliable.

3 KEY FINDINGS

3.1 RESPONSE RATES

able 1 describes the 2021–22 CDHS sample and presents the response rates. A total of 21,270 households were selected for the CDHS sample, of which 20,967 were found to be occupied. Of the occupied households, 20,806 were successfully interviewed, yielding a response rate of 99%. In the interviewed households, 19,845 women age 15–49 were identified as eligible for individual interview. Interviews were completed with 19,496 women, yielding a response rate of 98%. In the subsample of households selected for the male survey, 9,079 men age 15–49 were identified as eligible for individual interview and 8,825 were successfully interviewed, yielding a response rate of 97%.

Table 1 Results of the household and individual interviews

Number of households, number of interviews, and response rates, according to residence (unweighted), Cambodia DHS 2021–22

	Resid		
Result	Urban	Rural	Total
Household interviews			
Households selected	7,230	14,040	21,270

¹ Households interviewed/households occupied.

² Respondents interviewed/eligible respondents.

3.2 CHARACTERISTICS OF RESPONDENTS

Table 2 presents the weighted and unweighted numbers and percent distributions of women and men interviewed in the 2021–22 CDHS, by background characteristics. Results presented in this report are based on weighted data, so results are representative of the country, of urban and rural residence, and of each of the provinces.

Table 2 Background characteristics of respondents

Percent distribution of women and men age 15–49 by selected background characteristics, Cambodia DHS 2021–22

- For both women and men, the percentage who are age 45–49 (9% and 8% respectively) is much smaller than any of the other age groups, reflecting a relatively younger population in Cambodia.
- Almost all women and men (97% each) are Buddhist.
- 72% of women and 73% of men reported that they have are in good or very good health; only 3% of women and 2% of men reported that their health was bad or very bad.
- One in 4 women (25%) and slightly more than 1 in 3 men (35%) have never been married. The majority of women (68%) and men (61%) are currently married; 1% of both women and men are living with someone as if married. About 4% of female respondents and 3% of male respondents are divorced or separated.
- Six in 10 women and men (58% and 57%, respectively) live in rural areas.
- By province, the largest percentage of female and male respondents (16% and 17%, respectively) are in Phnom Penh; less than 1% each of respondents are in Mondul Kiri, Kep, Pailin, and Koh Kong.
- 50% of women and 58% of men have attended secondary school or higher; 12% of women and 6% of men have no education.

3.3 FERTILITY

Total fertility rate

The average number of children a woman would have by the end of her childbearing years if she bore children at the current age-specific fertility rates. Age-specific fertility rates are calculated for the 3 years before the survey, based on detailed pregnancy histories provided by women. *Sample:* Women age 15–49

Table 3 shows age-specific fertility rates (ASFRs) among women by 5-year age groups for the 3-year period preceding the survey and the total fertility rate (TFR).

- If fertility were to remain constant at current levels, a woman in Cambodia would bear an average of 2.7 children in her lifetime.
- Fertility is low among adolescents (48 births per 1,000 women age 15–19), peaks at 154 births per 1,000 among women age 20–24, and then deceases thereafter.

Table 3 Current fertility

Age-specific and total fertility rates, general fertility rate, and the crude birth rate for the 3 years preceding the survey, according to residence, Cambodia DHS 2021–22

Age group	Urban	Rural	Total
15–19	39	55	48
20–24	128	174	154
25–29	127	166	149
30–34	107	112	110
35–39	57	64	61
40–44	23	24	24
45–49	[3]	[3]	[3]
TFR (15–49)	2.4	3.0	2.7
GFR	85	100	94
CBR	20.5	20.1	20.2

Notes: Age-specific fertility rates are per 1,000 women. Estimates in brackets are truncated. Rates are for the period 1–36 months preceding the interview.

TFR: Total fertility rate expressed per woman GFR: General fertility rate expressed per 1,000

women age 15–44

CBR: Crude birth rate, expressed per 1,000 population

Trends: The overall fertility rate has declined from 3.8 births per woman in 2000 to 2.7 births in 2014 and has remained unchanged in 2021–22 (**Figure 1**). The apparent changes in urban and rural fertility rates between 2014 and 2021–2022 are due to reclassification of about 20% of rural EAs to urban EAs in the 2019 General Population Census.

3.4 TEENAGE FERTILITY

Teenage pregnancy

Percentage of women age 15–19 who have ever been pregnant. **Sample:** Women age 15–19 Figure 1 Trends in fertility by residence

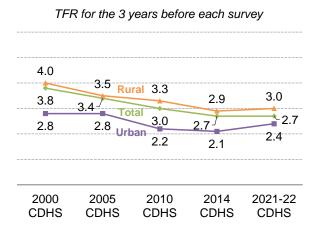

Table 4 shows the percentage of women age 15–19 who have ever been pregnant at the time of the survey, according to background characteristics.

Table 4 Teenage pregnancy

Percentage of women age 15–19 who have ever had a live birth, percentage who have ever had a pregnancy loss, percentage who are currently pregnant, and percentage who have ever been pregnant, according to background characteristics, Cambodia DHS 2021–22

	Percentage of women age 15–19 who:

Highest	3.7	1.9	0.4	4.1	573			
Total	6.6	1.7	2.5	9.3	2,981			
¹ Stillbirth, miscarriage,	or abortion							

- Overall, 9% of women age 15–19 have ever been pregnant, 7% have had a live birth, 2% have had a pregnancy loss, and 3% are currently pregnant.
- The percentage of women age 15–19 who have ever been pregnant rises with age, from 2% at age 15 to 30% by age 19.
- . Women age 15–19 who have ever been pregnant is correlated with lack of education; 35% of teenagers with no education have ever been pregnant compared with 7% with secondary education and 0% with more than secondary education.

3.5 **FERTILITY PREFERENCES**

Desire for another child

Women were asked whether they wanted more children and, if so, how long they would prefer to wait before the birth of the next child. Women who are sterilized are assumed not to want any more children. Sample: Currently married women age 15-49

Table 5 shows fertility preferences among currently married women age 15–49 by number of living children.

- 14% of women want another child soon (within the next 2 years) and 17% want to have another . child later (in 2 or more years), and 3% want another child but have not decided when.
- 50% of women want no more children, 4% are sterilized, 3% are infecund.
- The percentage of women who want no more children rises with the number of living children she has, from 5% of women with no living children to 82% of women with six or more children.

Table 5 Fertility preferences by number of living children

Percent distribution of currently married women age 15-49 by desire for children, according to number of living children, Cambodia DHS 2021-22

¹ The number of living children includes a woman's current pregnancy.
² Wants next birth within 2 years

³ Wants to delay next birth for 2 or more years

⁴ Includes both female and male sterilization

3.6 FAMILY PLANNING

3.6.1 Contraceptive use

Contraceptive prevalence

Percentage of women who use any contraceptive method *Sample:* Currently married women age 15–49 and sexually active unmarried women age 15–49

Modern methods

Include male and female sterilization, injectables, intrauterine devices (IUDs), contraceptive pills, implants, female and male condoms, emergency contraception, the standard days method, and lactational amenorrhea method.

Table 6 presents contraceptive use among currently married women and sexually active, unmarried women.

- 62% of currently married women are using a method of contraception, 45% are using a modern method, and 17% are using a traditional method.
- Among currently married women, the contraceptive pill is the most commonly used modern method (26%), followed by injectables (6%), and IUD (5%).
- Although currently married women in urban areas are more likely than those in rural areas to use any method of contraception (66% versus 59%), women in rural areas are more likely to use modern methods than urban women (47% versus 41%). Use of any traditional method of contraception among currently married women is higher in urban areas (24%) than in rural areas (12%).

Table 6 Current use of contraception according to background characteristics

Percent distribution of currently married women and sexually active unmarried women age 15–49, by contraceptive method currently used, according to background characteristics, Cambodia DHS 2021–22

Note: If more than one method is used, only the most effective method is considered in this tabulation.

SDM = Standard days method LAM = Lactational amenorrhea method Other modern method includes Female Condom (1 case), Emergency Contraception (6 cases), LAM (9 cases), and Male Sterilization (6 cases). ¹ Women who have had sexual intercourse within 30 days preceding the survey.

Trends: Contraceptive prevalence among currently married women has increased steadily, from 24% in 2000 to 62% in 2021–22. Over this same period, the use of any modern method has climbed from 19% to 45% (**Figure 2**).

3.6.2 Need and demand for family planning

Need for family planning

Unmet need for family planning

Proportion of women who (1) are not pregnant and not postpartum amenorrheic and are considered fecund and want to postpone their next birth for 2 or more years or stop childbearing altogether but are not using a contraceptive method, or (2) have a mistimed or unwanted current pregnancy, or (3) are postpartum amenorrheic and their last birth in the last 2 years was mistimed or unwanted.

Sample: All women age 15–49, currently married women age 15–49, and sexually active unmarried women age 15–49

Met need for family planning

Current contraceptive use (any method)

Sample: Currently married women age 15–49 and sexually active unmarried women age 15–49

Demand for family planning:	Unmet need for family planning + met need (current contraceptive use (any method))
Proportion of demand satisfied:	Current contraceptive use (any method) Unmet need + current contraceptive use (any method)
Proportion of demand satisfied by modern methoo	Current contraceptive use (any modern method) Unmet need + current contraceptive use (any method) ds:

Table 7 presents data on unmet need, met need, and total demand for family planning services for currently married and sexually active unmarried women. These indicators help evaluate the extent to which family planning programs in Cambodia are meeting the demand for services.

- Overall, the total demand for family planning among currently married women is 74%. This demand consist of the 62% of currently married women who have a met need for family planning—that is, they are currently using a contraceptive method—and the 12% of currently married women have an unmet need for family planning. If all currently married women who said they want to space or limit their children were to use family planning methods, the contraceptive prevalence would increase from 62% to 74%.
- The total demand for family planning that is satisfied is 84%; 61% of the total demand is satisfied by modern methods.

Table 7 Need and demand for family planning among currently married women and sexually active unmarried women

Percentage of currently married women and sexually active unmarried women age 15–49 with unmet need for family planning, percentage with met need for family planning who are using modern methods, percentage with demand for family planning, percentage of the demand for family planning that is satisfied, and percentage of the demand for family planning that is satisfied with modern methods, according to background characteristics, Cambodia DHS 2021– 22

Total	59.7	28.8	28.8	88.5	60	32.6	32.6

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al. 2012.

¹ Percentage of demand satisfied is met need divided by total demand.
 ² Modern methods include female sterilization, male sterilization, IUD, injectables, implants, pill, male condom, female condom, emergency contraception, standard days method (SDM), lactational amenorrhea method (LAM), and other modern methods.
 ³ Total demand is the sum of unmet need and met need.

⁴ Women who have had sexual intercourse within 30 days preceding the survey.

Trends: Figure 2 shows the total demand for family planning among currently married women has increased from 57% in 2000 to 74% in 2021–22.

Over this time period, unmet need has declined from 33% in 2000 to 12% in 2021–22.

The use of modern contraceptives has increased from 19% in 2000 to 45% in 2021–22. The use of traditional methods has increased from 5% in 2000 to 18% in 2014 and has since leveled off (17% in 2021–22).

Table 8 presents estimates for three

successive 5-year periods prior to the

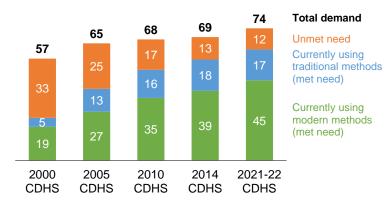

2021–22 CDHS. The rates are estimated

rate was 16 deaths per 1,000 children.

directly from the information collected as part of a retrospective pregnancy history, in which female respondents list all of the children to whom they have given birth, along with each child's date of birth, survivorship status, and current

Figure 2 Trends in use, need, and demand for family planning

Percentage of currently married women age 15-49

3.7 EARLY CHILDHOOD MORTALITY

Neonatal mortality:	The probability of dying within the first month of life
Postneonatal mortality:	The probability of dying between the first month of life and the first birthday (computed as the difference between infant and neonatal mortality)
Infant mortality:	The probability of dying between birth and the first birthday
Child mortality:	The probability of dying between the first and fifth birthday
Under-5 mortality:	The probability of dying between birth and the fifth birthday

Table 8 Early childhood mortality rates

Neonatal, post-neonatal, infant, child, and under-5 mortality rates for 5-year periods preceding the survey, Cambodia DHS 2021–22

Years preceding the survey	Neonatal mortality (NN)	Post- neonatal mortality (PNN) ¹	Infant mortality (1q0)	Child mortality (4q1)	Under-5 mortality (₅q₀)
0-4	8	4	12	4	16
5-9	10	7	18	4	22
10-14	15	10	25	5	30

age or age at death.
During the 5 years immediately preceding the survey, the neonatal mortality rate was 8 deaths per 1,000 live births, the infant mortality rate is 12 deaths per 1,000 births, and the under-5 mortality

Mortality during the first month (neonatal mortality) accounts for 66% of infant deaths and 50% of under-5 deaths.

Trends: Figure 3 presents trends in childhood mortality, as assessed through the current and previous CDHS. Under-5 mortality decreased from 124 deaths per 1,000 live births during the 5 years preceding the 2000 CDHS to 16 deaths per 1,000 live births in the most recent 5-year period. Infant and neonatal mortality have similarly declined.

3.8 MATERNAL CARE

Proper care during pregnancy and delivery is important for the health of both the mother and the baby. **Table 9** presents key indicators related to maternal care.

Figure 3 Trends in early childhood mortality rates

Deaths per 1,000 live births in the 5-year period preceding the survey

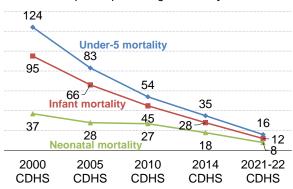

Table 9 Maternal care indicators

Among women age 15-49 who had a live birth and/or a stillbirth in the 2 years preceding the survey, percentage who received antenatal care (ANC) from a skilled provider for the most recent live birth or stillbirth, percentage with four or more ANC visits for the most recent live birth or stillbirth, percentage who took any ironcontaining supplements during pregnancy, and percentage whose most recent live birth was protected against neonatal tetanus; among all live births and stillbirths in the 2 years before the survey, percentage delivered by a skilled provider and percentage delivered in a health facility; and among women age 15–49 with a live birth or stillbirth in the 2 years preceding the survey, percentage who received a postnatal check during the first 2 days after giving birth, according to background characteristics, Cambodia DHS 2021-22

Note: If more than one source of assistance was mentioned, only the provider with the highest qualifications is considered in this tabulation.

na = not applicable ¹ Skilled provider includes doctor, nurse/midwife, and auxiliary midwife. ² Iron tablets and syrup

³ Includes mothers with two injections during the pregnancy of her most recent live birth, or two or more injections (the last within 3 years of the most recent live birth), or three or more injections (the last within 5 years of the most recent live birth), or four or more injections (the last within 10 years of the most recent live birth), or five or more injections at any time prior to the last live birth. ⁴ Includes women who received a check from a doctor, midwife, nurse, community health worker, or traditional birth attendant.

⁵ For women who had both a live birth and a stillbirth in the 2 years preceding the survey, data on antenatal care and postnatal checks are tabulated for the most recent birth only.

3.8.1 Antenatal care

Antenatal care (ANC) from a skilled provider Pregnancy care received from skilled providers, such as doctors, nurses/midwives, and auxiliary midwives. *Sample:* Women age 15–49 who had a live birth or stillbirth in the 2 years before the survey

Antenatal care (ANC) from a skilled provider is important to monitor pregnancy and reduce morbidity and mortality risks for the mother and child during pregnancy, at delivery, and during the postnatal period.

- Nearly all of women (99%) reported receiving antenatal care from a skilled provider for their most recent live birth or stillbirth in the 2-year period before the survey.
- Overall, 86% of women had four or more ANC visits for their most recent live birth or stillbirth.
- 98% of women took iron-containing supplements during their most recent pregnancy.

Trends: The percentage of women who received antenatal care for their most recent live birth in 2 years preceding the survey increased from 39% in 2000 to 99% in 2021–22, and the percentage who received four or more ANC visits increased from 9% in 2000 to 86% in 2021–22.

3.8.2 Tetanus toxoid

Protection against neonatal tetanus

The number of tetanus toxoid injections needed to protect a baby from neonatal tetanus depends on the mother's vaccinations. A birth is protected against neonatal tetanus if the mother has received any of the following:

- Two tetanus toxoid injections during the pregnancy
- Two or more injections, the last one within 3 years of the birth
- Three or more injections, the last one within 5 years of the birth
- Four or more injections, the last one within 10 years of the birth
- Five or more injections at any time prior to the birth

Sample: Last live births in the 2 years before the survey to women age 15-49

Tetanus toxoid injections are given during pregnancy to prevent neonatal tetanus, a major cause of early infant death in many developing countries, often due to failure to observe hygienic procedures during delivery.

- Overall, 92% percent of women with a live birth in the 2 years before the survey received sufficient tetanus toxoid injections to protect their baby against neonatal tetanus.
- Differences in protection against neonatal tetanus were generally small, with the exception that only 68% of women in Ratanak Kiri received sufficient tetanus toxoid injections to protect their child against neonatal tetanus.

3.8.3 Delivery care

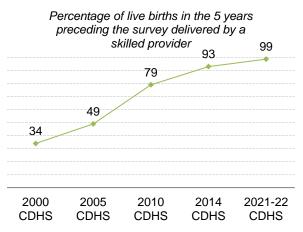

Institutional deliveries Deliveries that occur in a health facility. *Sample:* All live births and/or stillbirths in the 2 years before the survey Skilled assistance during delivery

Births delivered with the assistance of doctors, nurses/midwives, and auxiliary midwives.

Sample: All live births and/or stillbirths in the 2 years before the survey

Access to proper medical attention and hygienic conditions during delivery can reduce the risk of complications and infections that could lead to death or serious illness for the mother and/or baby (Van Lerberghe and De Brouwere 2001; WHO 2006a).

- Overall, 99% of live births and stillbirths were assisted by a skilled provider (Figure 4).
- Nearly all live births (98%) took place in a health facility; only 74% of stillbirths occurred at a health facility.

Trends: The percentage of live births that are assisted by a skilled provider has increased markedly over the past 2 decades, from 34% in 2000 to 99% in 2021–22.

3.8.4 Postnatal care for the mother

A large proportion of maternal and neonatal deaths occur during the first 48 hours after delivery. Thus, prompt postnatal care (PNC) to treat any complications arising from the delivery is important for both the mother and the child, as well as to provide the mother with information on how to care for herself and her child. Safe motherhood programs recommend that all women receive a check of their health during the first 2 days after birth.

• Overall, 85% of women with a live birth in the 2 years preceding the survey received a postnatal check within 2 days after delivery; only 71% of women with a stillbirth received a postnatal check.

3.9 VACCINATION COVERAGE

Universal immunization of children against common vaccine-preventable diseases is crucial for reducing infant and child mortality. In Cambodia, routine childhood vaccines include BCG vaccine (tuberculosis), HepB vaccine (hepatitis B), DPT-HepB-Hib or pentavalent vaccine (diphtheria, tetanus, pertussis, hepatitis B, and *Haemophilus influenzae* type b), oral polio vaccine or OPV (poliomyelitis), inactivated polio vaccine or IPV (poliomyelitis), pneumococcal conjugate vaccine or PCV, and measles rubella (MR) vaccine.

Information on vaccination coverage was obtained in two ways in the 2021–22 CDHS: from written vaccination records, including vaccination or health cards, and from verbal reports from the mother. In the survey, the vaccination card was observed for 82% of children age 12–23 months and for 73% of children age 24–35 months (data not shown).

Figure 4 Trends in delivery assistance

3.9.1 Basic Antigen Coverage

Fully vaccinated—basic antigens

Percentage of children who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report). To have received all basic antigens, a child must receive at least:

- One dose of BCG vaccine, which protects against tuberculosis
- Three doses of polio vaccine given as oral polio vaccine (OPV),
- inactivated polio vaccine (IPV), or a combination of OPV and IPV
 Three doses of DPT-containing vaccine, which protects against
- diphtheria, pertussis (whooping cough), and tetanus
- One dose of measles-containing vaccine given as measles rubella (MR)

Sample: Living children age 12-23 months

Historically, an important measure of vaccination coverage has been the proportion of children receiving all basic antigens. Children are considered fully vaccinated against all basic antigens if they have received the BCG vaccine, three doses each of polio vaccine and DTP-containing vaccine, and a single dose of measles-containing vaccine. In Cambodia, the BCG vaccine is usually given at birth or at first clinic contact, while the polio and DPT-HepB-Hib vaccines are given at approximately age 6, 10, and 14 weeks. A first MR vaccination should be given at or soon after age 9 months.

- 67% of children age 12–23 months are fully vaccinated with basic antigens.
- Among the basic antigens, coverage was highest for BCG (94%).

3.9.2 Vaccination Coverage According to National Schedule

A second measure of vaccination coverage is the percentage of children age 12–23 months and 24–35 months who are fully vaccinated according to the national schedule. In Cambodia, a child age 12–23 months is considered to be fully vaccinated according to the national schedule if the child has received all basic antigens as well as a birth dose of HepB vaccine, a dose of IPV, three doses of HepB and Hib (given as part of DPT-containing vaccine), and three doses of the pneumococcal vaccine. Children age 24–35 months are considered fully vaccinated according to the national schedule if they receive a second dose of the MR vaccine in addition to all the vaccinations relevant for a child age 12–23 months.

- 65% of children age 12–23 and 55% of children age 24–35 months are fully vaccinated according to national schedule.
- 3% of children age 12–23 months have received no vaccinations.

Table 10 Vaccinations by background characteristics

Percentage of children age 12–23 months and children age 24–35 months who received specific vaccines at any time before the survey (according to a vaccination card or the mother's report), percentage fully vaccinated (basic antigens), percentage fully vaccinated (according to national schedule), and percentage who received no vaccinations, according to background characteristics, Cambodia DHS 2021–22

Trends: The percentage of children age 12–23 months who have been fully vaccinated against all basic antigens peaked at 79% in 2010, has declined to 73% in 2014, and slightly increased to 76% in 2021–22 (**Figure 5**). The percentage of children with no vaccinations has changed little since 2010.

3.10 CARESEEKING AND TREATMENT OF CHILD ILLNESS

Acute respiratory infection (ARI), fever, and dehydration from diarrhea are important contributing causes of childhood morbidity and mortality in developing countries (WHO 2003). Prompt medical attention when a child has the symptoms of these illnesses is, therefore, crucial in reducing child deaths.

Figure 5 Trends in childhood vaccinations

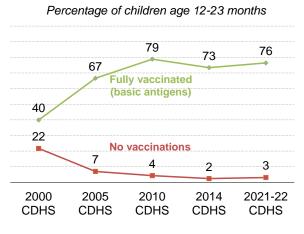

Table 11 presents information on careseeking for ill children in Cambodia. Overall, 1% of children under age 5 showed symptoms of an ARI, 13% exhibited fever, and 6% experienced diarrhea in the 2 weeks preceding the survey (data not shown).

- Advice or treatment was sought for 92 % of children with symptoms of ARI in the 2 weeks before the survey.
- Advice or treatment was sought for 80% of children with fever in the 2 weeks before the survey.
- Advice or treatment was sought for 69% of children with diarrhea in the 2 weeks before the survey.
- 29% of children with diarrhea received ORS, 13% received zinc supplements, 10% received ORS and zinc supplements, and 8% received ORS, zinc supplements, and continued feeding.

Table 11 Treatment for symptoms of ARI, fever, and diarrhea

Among children under age 5 who had symptoms of acute respiratory infection (ARI) or had fever during the 2 weeks preceding the survey, percentage for whom advice or treatment was sought; and among children under age 5 who had diarrhea during the 2 weeks preceding the survey, percentage for whom advice or treatment was sought, percentage given a fluid made from oral rehydration salt (ORS) packets or given pre-packaged ORS fluid, percentage given zinc, percentage given ORS and zinc, and percentage given ORS, zinc, and continued feeding, according to background characteristics, Cambodia DHS 2021–22

Note: Figures in parentheses are based on 25-49 unweighted cases. An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has ¹ Symptoms of ARI include short, rapid breathing that was chest-related, and/or difficult breathing that was chest-related.
 ² Includes advice or treatment from the following sources: public sector, private medical sector, NGO medical sector, and other.
 ³ Continued feeding includes children who were given more, same as usual, or somewhat less food during the diarrhea episode.

3.11 CHILD NUTRITIONAL STATUS

Anthropometry is commonly used to measure child nutritional status. The anthropometric measurements are used to report on child growth indicators. The distribution of height and weight for children under age 5 is compared with the WHO growth standard reference population (WHO 2006b). The distribution of a well-nourished population will be similar to the reference population, while the distribution of a poorly nourished population will not. The indices height-for-age, weight-for-height, and weight-for-age can be expressed in standard deviation units (*Z*-scores) from the median of the reference population. Values that are greater than two standard deviations below the median of the WHO child growth standards are used to define malnutrition.

Stunting (assessed via height-for-age)

Height-for-age is a measure of growth faltering. Children whose height-for-age Z-score is below minus two standard deviations (-2 SD) from the median of the reference population are considered short for their age (stunted). Children who are below minus three standard deviations (-3 SD) are considered severely stunted.

Sample: Children under age 5

Wasting (assessed via weight-for-height)

The weight-for-height index measures body mass in relation to body height or length and describes acute undernutrition. Children whose *Z*-score is below minus two standard deviations (-2 SD) from the median of the reference population are considered thin (wasted). Children whose weight-for-height *Z*-score is below minus three standard deviations (-3 SD) from the median of the reference population are considered severely wasted.

Sample: Children under age 5

Underweight (assessed via weight-for-age)

Weight-for-age is a composite index of height-for-age and weight-for-height that takes into account both wasting and stunting. Children whose weight-for-age Z-score is below minus two standard deviations (-2 SD) from the median of the reference population are classified as underweight. Children whose weight-for-age Z-score is below minus three standard deviations (-3 SD) from the median are considered severely underweight.

Sample: Children under age 5

Overweight (assessed via weight-for-height)

Children whose weight-for-height *Z*-score is more than two standard deviations (+2 SD) above the median of the reference population are considered overweight.

Sample: Children under age 5

A total of 4,443 children (unweighted) under age 5 were eligible for weight and height measurements. For some of the eligible children, however, complete and credible data on height, weight, and/or age were not obtained. In this report, height-for-age is based on 95% of eligible children, weight-for-height is based on 96% of eligible children, while weight-for-age is based on 98% of eligible children.

Table 12 shows the nutritional status for children under age 5, according to the three anthropometric indices: 22% of children under age 5 are stunted, 10% are wasted, and 16% are underweight. Four percent of children under 5 are overweight.

Table 12 Nutritional status of children

Percentage of children under age 5 classified as malnourished according to three anthropometric indices of nutritional status: height-for-age, weight-for-height, and weight-for-age, according to background characteristics, Cambodia DHS 2021–22

3		21.9	-1.0	4,153	2.4	9.6	4.1	-0.5	4,160	3.0	16.3	-0.9	4,234

Note: Each of the indices is expressed in standard deviation units (SD) from the median of the WHO Child Growth Standards. Total includes one case for which mother's education information is missing.

¹ Recumbent length is measured for children under age 2; standing height is measured for all other children ² Includes children who are below -3 SD from the WHO Growth Standards population median

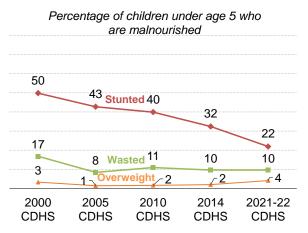

³ Includes children whose mothers are deceased ⁴ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the Household Questionnaire.

Trends: A comparison of anthropometric measures from the previous surveys shows that the prevalence of stunting has decreased from 50% in 2000 to 22% in 2021–22 (**Figure 6**). The percentage of children who are wasted and overweight has changed little since 2005.

3.12 INFANT AND CHILD FEEDING

Optimal infant and young child feeding (IYCF) practices are critical to the health and survival of young children. Recommended IYCF practices include early initiation of breastfeeding within the first hour of life, exclusively breastfeeding for the first 6 months of life, and feeding children a diet that meets a minimum diversity (WHO and UNICEF 2021).

Figure 6 Trends in nutritional status of children

Early initiation of breastfeeding

Percentage of children age 0-23 months who were put to the breast within 1 hour of birth

Sample: Children age 0-23 months

Exclusive breastfeeding under 6 months

Percentage of children age 0–5 months who are fed exclusively with breastmilk during the previous day

Sample: Youngest children age 0-5 months living with the mother

Minimum dietary diversity 6-23 months

Percentage of children age 6–23 months who are fed a minimum of 5 out of 8 defined food groups during the previous day. The eight food groups are as follows: breastmilk; grains, roots, and tubers; legumes and nuts; dairy products (milk yogurt, cheese); flesh foods (meat, fish, poultry, and organ meat); eggs; vitamin A-rich fruits and vegetables; and other fruits and vegetables.

Sample: Youngest children age 6-23 months living with the mother

Key IYCF indicators are presented in Table 13.

- 54% of children age 0–23 months engaged in early initiation of breastfeeding.
- 51% of children age 0–5 months were exclusively breastfed.
- 51% of children age 6–23 months met the minimum dietary diversity.

Indicator	Indicator numerator and denominator	Value		
Early initiation of breastfeeding	Percentage of children age 0-23 months who were put to the breast within 1 hour of birth	53.8		
	Number of children age 0-23 months	3,290		
Exclusive breastfeeding under	Percentage of children age 0-5 months who were fed exclusively with breastmilk during the previous day			
6 months	Number of youngest children age 0-5 months living with the mother	809		
Minimum dietary diversity 6-23 months	Percentage of children age 6-23 months who were fed foods and beverages from at least 5 out of 8 defined food groups during the previous day			
	Number of youngest children age 6-23 months living with the mother	2,321		
Sweet beverage consumption 6-23	Percentage of children age 6-23 months who were given a sweet beverage during the previous day	28.4		
months	Number of youngest children age 6-23 months living with the mother	2,321		
Unhealthy food consumption 6-23	Percentage of children age 6-23 months fed unhealthy foods during the previous day	20.9		
months	Number of youngest children age 6-23 months living with the mother	2,321		

Unhealthy infant and young child feeding practices should be avoided because they can replace nutritious foods that provide important nutrients for children and promote unhealthy weight gain. For infants and young children, the consumption of sweet foods and beverages increases the risk of dental caries and obesity in childhood. The indicator definition below for unhealthy food consumption describes sentinel unhealthy foods, which are foods that are high in sugar, salt, or unhealthy fats that are commonly consumed by infants and young children (WHO and UNICEF 2021).

Sweet beverage consumption 6-23 months

Percentage of children age 6–23 months who are given a sweet beverage during the previous day

Unhealthy food consumption 6-23 months

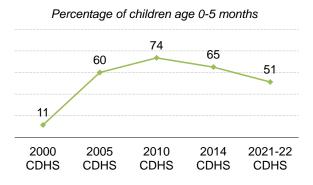

Percentage of children age 6–23 months who are fed sentinel unhealthy foods during the previous day

Sample: Youngest children age 6-23 months living with the mother

- 28% of children age 6–23 months were fed a sweet beverage.
- 21% of children age 6–23 months consumed unhealthy foods.

Trends: Exclusive breastfeeding among children age 0–5 months rose from 11% in 2000 to a peak of 74% in 2010 and has declined subsequently, from 65% in 2014 to 51% in 2021–22 (**Figure 7**).

Figure 7 Trends in exclusive breastfeeding

3.13 HIV

3.13.1 Prevention knowledge among young people

Knowledge about HIV prevention

Knowing that consistent use of condoms during sexual intercourse and having just one uninfected faithful partner can reduce the chances of getting HIV, knowing that a healthy-looking person can have HIV, and rejecting two major misconceptions about HIV transmission: HIV can be transmitted by mosquito bites and a person can become infected by sharing food with a person who has HIV.

Sample: Women and men age 15-24

Knowledge of how HIV is transmitted is crucial to enabling people to avoid HIV infection, and this is especially true for young people, who are often at greater risk because they may have shorter relationships with more partners or engage in other risky behaviors.

- 74% of young women and 83% of young men know that consistent use of condoms can reduce the risk of getting HIV (**Table 14**).
- 75% of young women and 79% of young men know that having just one uninfected partner can reduce the chance of getting HIV.
- Only 23% of young women and 27% of young men have a thorough knowledge of HIV prevention methods, meaning that in addition to knowing about consistent use of condoms and limiting sexual intercourse to one uninfected partner, they know that healthy looking people can be infected with HIV, and they reject the two most common misconceptions about transmission of HIV.

Table 14 Knowledge about HIV prevention methods among young people

Percentage of young women and young men age 15–24 who, in response to prompted questions, say that people can reduce the risk of getting HIV by using condoms every time they have sexual intercourse, and by having one sex partner who is not infected and has no other partners, and percentage who correctly identify both ways of preventing the sexual transmission of HIV and reject major misconceptions about HIV transmission, according to background characteristics, Cambodia DHS 2021–22

Note: An asterisk indicates that a figure is based on fewer than 25 unweighted cases and has been suppressed.

¹ Using condoms every time they have sexual intercourse

² Partner who has no other partners

³ Knowledge about HIV prevention means knowing that consistent use of condoms during sexual intercourse and having just one uninfected faithful partner can reduce the chance of getting HIV, knowing that a healthy-looking person can have HIV, and rejecting two common misconceptions about transmission or prevention of HIV: HIV can be transmitted by mosquito bites and a person can become infected by sharing food with a person who has HIV.

3.13.2 Sexual behavior

Information on sexual behavior is important in designing and monitoring intervention programs to control the spread of HIV.

Table 15.1 Multiple sexual partners and higher-risk sexual intercourse in the last 12 months: Women

Among all women age 15–49, percentage who had sexual intercourse with more than one sexual partner in the last 12 months, and percentage who had intercourse in the last 12 months with a person who was neither their husband nor lived with them; among those having more than one partner in the last 12 months, percentage reporting that a condom was used during last intercourse; among women age 15–49 who had sexual intercourse in the last 12 months with a person who was neither their husband nor lived with them, percentage who used a condom during last sexual intercourse with such a partner; and among women who ever had sexual intercourse, mean number of sexual partners during their lifetime, according to background characteristics, Cambodia DHS 2021-22

	All women			Women who ha in the last 1		Women who ha in the last 12 n person who wa husband nor liv	nonths with a s neither their	Women who ever had sexual intercourse ¹

- Among women age 15–49, less than 1% had two or more partners in the last 12 months, and among those who did, 2% reported using a condom during the last sexual intercourse (Table 15.1).
- Among women age 15–49, less than 1% had sexual intercourse with a person who was neither their husband nor lived with them, and among those who did, 47% reported using a condom during the last sexual intercourse with this person.
- Among women age 15–49 who ever had sexual intercourse, the mean number of lifetime sexual partners was 1.2.
- Among men age 15–49, 2% had two or more partners in the last 12 months, and among those who had two or more partners, 2% reported using a condom during the last sexual intercourse (Table 15.2).
- Among men age 15–49, less than 4% had sexual intercourse with a person who was neither their wife nor lived with them, and among those who did, 76% reported using a condom during the last sexual intercourse with this person.
- Among men age 15–49 who ever had sexual intercourse, the mean number of lifetime sexual partners was 4.1.

3.13.3 Prior HIV testing

HIV testing programs diagnose people living with HIV so that they can be linked to care and access antiretroviral therapy (ART). Knowledge of HIV status helps HIV negative individuals reduce risk and remain negative.

- Overall, 47% of women and 30% of men age 15–49 have ever been tested for HIV (**Table 16.1** and **Table 16.2**, respectively). Nearly all of those who were ever tested received the test results.
- Only 7% percent of women and 2% of men age 15–49 were tested in the 12-month period preceding the survey and received the results of the last test they took.

Table 16.1 Coverage of prior HIV testing: Women

Percent distribution of women age 15–49 by HIV testing status and by whether they received the results of the last test, percentage of women ever tested, and percentage of women who were tested in the last 12 months and received the results of the last test, according to background characteristics, Cambodia DHS 2021–22

3.14 MATERNAL MORTALITY

Maternal mortality rate

The number of maternal deaths per 1,000 women age 15–49. Maternal mortality rates by 5-year age groups are calculated by dividing the number of maternal deaths to female siblings of respondents in each age group by the total person-years of exposure of the sisters to the risk of dying in that age group during the 7 years preceding the survey. The number of deaths is the number of sisters reported as having died in the 7 years preceding the survey either during pregnancy or delivery, or in the 42 days following the delivery or termination of a pregnancy, by their age group at the time of death; deaths due to accident or violence are excluded. The person-years of exposure in each age group are calculated for both surviving and dead sisters based on their reported current age (living sisters) or age at death and years since death (dead sisters).

Sample: Sisters (both living and dead) age 15–49 in the 7 years preceding the survey, by 5-year age groups

Maternal mortality ratio

The number of maternal deaths per 100,000 live births. The maternal mortality ratio is calculated by dividing the age-standardized maternal mortality rate for women age 15–49 in the 7 years preceding the survey by the general fertility rate (GFR) for the same time period.

Estimates of the maternal mortality ratio (MMR) and the lifetime risk of maternal death for the period 0–6 years before the survey are shown in **Table 17**. Age-specific maternal mortality rates are calculated by dividing the number of maternal deaths by years of exposure (not shown). Maternal deaths are defined as any death that occurred during pregnancy, childbirth, or within 42 days (6 weeks) after the birth or termination of a pregnancy, excluding deaths due to accident or injury. Maternal deaths are a relatively rare occurrence and should be interpreted with caution. The MMR, obtained by dividing the age-standardized maternal mortality rate by the age-standardized general fertility rate, is often considered a more useful measure of maternal mortality since it measures the obstetric risk associated with each live birth.

Table 17 Maternal mortality ratio

Total fertility rate, general fertility rate, maternal mortality ratio, and lifetime risk of maternal death for the 7 years preceding the survey, Cambodia DHS 2021–22

Total fertility rate (TFR)	2.7
General fertility rate (GFR) ¹	81
Maternal mortality ratio (MMR) ²	154 c.i.: (69, 239)
Lifetime risk of maternal death ³	0.004

c.i. is confidence interval

¹ Age-adjusted rate expressed per 1,000 women age 15–49

² Expressed per 100,000 live births; calculated as the age-adjusted maternal mortality rate times 100 divided by the age-adjusted general fertility rate

³ Calculated as 1 –(1 – MMR)^{TFR} where TFR represents the total fertility rate for the 7 years preceding the survey

Table 17 shows that the MMR for the period 2014 to 2021–22 is 154 deaths per 100,000 live births. The lifetime risk of a maternal death is 0.004, which indicates that for every 1,000 women, 4 will have a maternal death.

3.15 **CHILD DISCIPLINE**

Only nonviolent discipline

Took away privileges, forbade something the child liked, or did not allow the child to leave the house; explained why the child's behavior was wrong, gave the child something else to do.

Psychological aggression

Shouted, yelled at, or screamed at the child, called the child dumb, lazy, or another name like that.

Any physical punishment

Shook, spanked, hit, or slapped on the bottom with bare hand; hit on the bottom or elsewhere on the body with something like a belt, hairbrush, stick, or other hard object; hit or slapped the child on the face, head, or ears; hit or slapped on the hand, arm, or leg, or beat up, that is hit over and over as hard as one could.

Severe physical punishment

Hit or slapped on the face, head, or ears, or beat up, that is hit over and over as hard as one could.

The 2021-22 CDHS asked adults about the disciplining methods they used with their children in the month before the survey.

- Overall, two-thirds (66%) of Cambodian children age 1-14 experienced a violence discipline . method. Only 23% of children 1-14 years experienced nonviolent discipline.
- Almost three in five (59%) of children experienced psychological aggression, 43% experienced any physical punishment, and 5% experienced severe physical punishment such as hitting the child on the face or head.

Table 18 Child discipline

Percentage of children age 1-14 years by child disciplining methods experienced during the last one month, Cambodia DHS 2021-22

Background characteristics	Only nonviolent discipline ¹	Psychological aggression ²	Physical punishment: Any ³	Physical punishment: Severe⁴	Any violent discipline method	Number of children aged 1-14 years				
Sex										
Male	22.4	60.4	45.4	4.7	67.8	7,132				
Female	23.8	57.5	39.9	4.4	64.9	7,064				
Residence										
Urban	28.9	49.7	39.1	4.3	58.3	5,047				
Rural	19.9	64.1	44.6	4.7	70.8	9,149				
Total	23.1	59.0	42.7	4.5	66.4	14,196				

¹ Took away privileges, forbade something the child liked or did not allow the child to leave the house; explained why the child's behavior was wrong, gave the child something else to do

² Shouted, yelled at, or screamed at the child; called the child dumb, lazy, or another name like that

³ Shook, spanked, hit, or slapped on the bottom with bare hand; hit on the bottom or elsewhere on the body with something like a belt, hairbrush, stick, or other hard object; hit or slapped the child on the face, head, or ears; hit or slapped on the hand, ⁴ Hit or slapped on the face, head, or ears, or beat up, that is hit over and over as hard as one could

Only 27% of respondents who answered questions about child discipline believe that physical punishment is necessary to raise children properly (**Table 19**).

Table 19 Attitudes toward physical punishment

Percentage of respondents who believe that physical punishment is needed to bring up, raise, or educate a child properly, Cambodia DHS 2021–22

sically Number of ished respondents
7.5 7,132 5.8 7,064
3.2 5,047 9.3 9,149 7.1 14,196
